YEP !, , Mine was made on a "Rolled Quaker Oats" container. The only
thing I bought (Actually my Dad bought it) was the crystal with a cats
wisker for "tuning" [ca 1940] :-}

>The first "ham" receiver was a war surplus Navy super-regen set. It weighed about

My first Ham "set" was a Heath "sixer"[1965], crystal controlled on
six meters AM. Next one was a REAL step up, , , a ProComm six meter
sideband rig.

Yep, , those were the days alright, , , , Thank God the're gone, , ,

Yaesu FT40, 99 Channel radio. Includes tx/rx mod, tx and receives from 430 -484.This unit is LITERALLY the size of a pack of smokes, maybe a TINY bit deeper, but the same height and width. (Just add an antenna.) Does 99 channels Pl _AND_ DPL, Keypad programmable, dual VFO, digital voice (record up to 20 seconds from the radio or by mike and either play back through speaker OR back on the air! Record you call and never say it again! Searches PL & DPL (yep, don't know the PL? Just hit a key, and it tells you! (Can't find this in the manual, I think it;s a hidden trick.) Comes with low power battery pack, charger, manual, and box. Barely used. Would prefer Bay Area (California) but will ship. $275 BO. Must sell ASAP, make an offer, reply to eplatt@wco.com, or call 415-939-1037

3. ic3220-improve extended receive

Newsgroup: rec.radio.amateur.equipment
Date: 1996-10-01 00:00:00 UTC
From: Ronvandermey@worldaccess.nl
Message-ID: <52rrt0$so6@easy2.worldaccess.nl>
Source record: 193274

Is there someone who knows how to improve the extended
receive on a IC-3220??? I measured the sensitivity:
On 449.975 it's good. On 450.000 it's dramatically bad!!
I can't imagine there such a sharp filter in this radio.
Is there someone who figured this problem out?
My interests are for 460 - 470 MHZ.

US $250.00 (two hundred and fifty dollars) reward for each of the first 10 (ten) examples of a specific capacitor. The item is a TRW series X682 or X683 metallized film capacitor, hermetically sealed and produced in the period from approximately 1965 through 1975. These were manufactured in the range of .01 mfd to 12.0 mfd with voltage ratings of 50 volts to 600 volts DC. Any capacitance value and any voltage rating is satisfactory.

I haven't noticed overheating. I don't run cw so I have never noticed the
relay. I think the quality is very good. I had a problem initially with of
all things the blower. They use a system where the squirrel cage housing
is separate from the motor/blade assembly. The blades scraped the housing
when the amp got hot. They claimed that the factory in Bulgaria(?) was not
properly instructed on alignment. They fixed it in Colorado. I heard a
rumour once (at Dayton) of supposedly mismatched tubes and consequent
uneven power dissipation. I have no way of checking it. I held my hand
over the two chimneys in turn and the air seemed the same temp to me. I
can tune up by the numbers. But one thing it lacks compared to other Alpha
amps is vernier dials on the tune and load.

ron, w8gus.

7. Req info on VX-10 for FT-50

Newsgroup: rec.radio.amateur.equipment
Date: 1996-10-01 00:00:00 UTC
From: Victor Krenz <gdt778@freenet.mb.ca>
Message-ID: <Pine.SOL.3.91.961001173340.19617A-100000@winnie.freenet.mb.ca>
Source record: 193278

A while back someone was talking about a VX-10 voice encryption keypad
for the commercial version of the Yeasu FT-10/40/50. They said that it might
work on the amateur version of the FT-10/40/50. I talked to a ham outlet
about it and they said that they "heard" that it might work in the
FT-10/40 but possibly not on the 50. Just woundering if anyone has tried
one out and in a FT-50 or can confirm any of this.

Please e-mail me...

8. HELP: Icom 02AT Memory

Newsgroup: rec.radio.amateur.equipment
Date: 1996-10-01 00:00:00 UTC
From: Russ Fitzpatrick <fitztoo@concentric.net>
Message-ID: <32520674.4D2D@concentric.net>
Source record: 193279

My HT seems to have developed a loss of memory for the 600 khz shift. I can program in the shift OK from the keyboard, and it works OK, and also seems to save to memory.....until I hit MR (Memory Recall), and only the base frequency comes up in simplex. Is there maybe a small lithium battery hidden inside that could be dying....the radio is several years old. Thanks for any help you might send my way.

The modification may be a simple affair but it might not be the best
solution to your need. When you say they don't have gain controls, I
assume you are talking about a seperate preamp gain and master Vol.
control and you need additional preamp gain. If the amps are in fact old
enough to not have a master volume control than they might be worth more
stock. Most old (tube)amps that are unmodified are worth more than when
they were new so you might be be better served by just adding a stomp
box preamp that plugs into the amp input. If your amps are solid state
than modification may not make them sound any better and probably a lot
worse. An old tube amp has high(up to 600 V) voltages present at many
points in it's chassis so I would recommend any mods be done by a
reputible guitar amp tech that can be found in almost any good sized
town

22. Ear bud tech advice needed, pls help

Newsgroup: rec.radio.amateur.equipment
Date: 1996-10-01 00:00:00 UTC
From: AECS56A@prodigy.com
Message-ID: <52q6iq$kk4@useneta1.news.prodigy.com>
Source record: 193342

Hello, Perhaps you can send me in the right direction . . .

I own a pair of Radio shack BTX 121's business band radios and plan to use these as part of a video crew communications system.

I'm looking for a small type "ear bud" vox headset to use with these radios.
The model that Radio Shack makes is too too large. I need something less obtrusive and wondered if anyone knows of a smaller headset that can be used with the BTX-121? Radio shacks does sell a great small ear bud that works only with the motorola model. Or any that can be modified to fit it?

Any advice greatly appreciated. E-mail please.

Thanks

Bob

Hi everybody. I will be the speaker at the Raleigh Amateur Radio
Society tonight, and the topic is Telegraphy. I'm afraid that
one of the questions I may be asked is "What is IAMBIC?"
Does anyone know? I suspect it's an acronym for something,
but I can't imagine what.

Thanks, and 73.

Jeff

I recently aquired a zenith docking station, and am looking for a compatable laptop. The laptop must have the bus plug on the left rear of it. Preferably an inexpensive laptop, 8088-80286, with minimal HD (20-40) is okay.

The VFO runs on 3.5 Mhz for 80 meters and 7 Mhz for 40 thru 10. On VHF it run
in the 8Mhz range.

I like my 91B. LEDs read instantaneous power on SSB. The tetrode tubes
have just a 50 ohm resistor on the input so it is matched at any frequency
without input tuning networks etc. Takes 50 watts for full output. There
was an article in Communications Quarterly Summer 93, page 96 which
discusses the advantages of the tetrode vis-a-vis the more common grounded
grid triode circuits.

Charlie:
I've had the problem on both the 2m and 440 sides. This occurs when the battery pack voltage drops below about 5.5-5.7 volts. I've tried the rig with an external supply (lab grade) and verified these numbers using the built-in voltage display. BTW, on my unit, this display seems to be accurate to within .1 volt. Exactly why it happens, I don't know.

Jeff, my dictionary gives the following meaning for iamb, iambic, etc.

"a metrical foot consisting of one short syllable followed by one long
syllable or of one unstressed syllable followed by one stressed syllable"

Guess it fits... but you got to have vision and a way with words...

Hi Ron,

Thanks for the reply. I have a couple more questions about the 91B since
I've never used/seen one. How is the quality? Can you hear the T/R vacume
relay? Does your unit overheat? Can you reliably tune-up "by the numbers"?

Thanks,
Kory

If you haven't become proficient on the semi-automatic key (Vibroplex and other) 'bug', you probably can learn to 'squeeze' the iambic paddles; these make contact with the dit side and the dah side at the same time when pinched together. (the keyer then sends di-dah-di-dah...). This may be easier to send with than the single-bar key which makes contact either with the dit or dah side, but not both at once, but I've found it impossible to change over to the squeeze style, after a lifetime of bugs and W2TO keyers, etc. I use the Bencher paddle, but just press left for dah's and right for dits.

In short, you have an opportunity to try either or both styles with an iambic paddle. The Bencher is not at all 'touchy' but quite rugged. I use it mobile as well as fixed with no complaints.

Hello group,
I realize that this request is slightly askew for this group, but I thought that someone on here would have knowledge of electronics products, and will point me in the right direction.
I have two musical instrument amplifiers that are fairly old, and they do not have a gain function on them. I would like to modify them to include a gain function for the type of music that I anticipate playing. Does anyone know of a company that has an adjustable gain circuit already made-up that I can add to my amps? If not, what about schematics or instructions to build one?

Many thanks,

Ed Dunlevy

49. Problems with FT-50 and "all band receive" mod

Newsgroup: rec.radio.amateur.equipment
Date: 1996-10-01 00:00:00 UTC
From: "Ira L. Chavis" <chavis@mail.dec.com>
Message-ID: <32515491.639D@mail.dec.com>
Source record: 193369

Folks,

Im wondering if ive maybe missed a step here in Bill's (see below)steps
to "updating" the FT-50 to 76-999MHZ rcv. I followed the steps
verbatum with the MARS/CAP mod and ADMS-1C software. The radio went
into euro mode (auto rpt offset was set to 0) but the radio still
behaves as if just the extended recevie (lamp+knob+power) was done.
I can tell since the radio stops tuning past 200mhz.

Any idea's or other procedures which may work better or dont
I understand the end result of the mod.

Thanks
Ira WA1W

==========
Super-Hyper Awesome Mod... The mother of all Mods!!! (Requires
ADMS-1C software and MARS/CAP mod to be performed)
Receive: 76-999 Mhz (No displayable holes!!!)
Transmit: 120-221 Mhz, 320-499 Mhz (AGAIN, Don't transmit on
frequencies where you're not licensed)
NOTE: This mod will disable ARS (automatic repeater shift) and will
set 2m and 440 repeater offset to
weird numbers. Make sure you enter repeater offset and +-
shift manually. Repeater offset needs
be set once for the rig, then it should be able to be
forgotten about. It will also clear memories.
Remember above where I mentioned the ADMS-1C software having a bug?
Here's where the enterprising and curious ham can take advantage
of that. This mod will install the European band plan in your
radio...so without the MARS/CAP mod you will lose the top portion of
your 2m band.
1. Are there frequencies in your radio? Don't want to lose them?
Simply get the data from your radio as it sits... you can "merge" the
frequencies later. Save the file.
2. Perform the MARS/CAP mod as outlined above. Get the data from
the mod and name it USA.RDF.
3. Attempt to send the same data to the radio. In the middle of
the transfer (around 50%), pull the adapter cable to the PC out of
the radio.
4. Thanks to the bug, your radio is now in European mode! Perform
the Extended Receive Mod by holding the Knob and Lamp keys down
while turning the unit on.
5. Now, the Automatic Repeater offset doesn't work. There's no
workaround. Note that the 2m offset has been changed to 0.00. Go

to the menu by holding down the knob. Go to SHFT, Option 7. Press the knob. Turn the knob so that it reads 0.60. Press PTT.
6. Now, turn off the radio. Put it back into clone mode. Read the data back from the radio to the PC and save the file as EURO.RDF.
7. If you want to enter frequencies manually or using ADMS as normal, go ahead. Everything should work. If you saved frequencies as above, open EURO.RDF and "merge" the frequencies from your USA.RDF file into it, and save it as another name. Then send the modified EURO.RDF (your filename) file back to the radio using the "template" file EURO.RDF. You're done!
8. To return the radio back to the U.S. band plan, send the USA.RDF file back to it.
Note that I have no way of measuring the sensitivity of the frequencies or the output power of the rig outside of the ham bands. The 220 coverage seems to be very poor, however, the radio does display 220 frequencies. It won't transmit on our 220 bands, though. 800 Mhz receive is vastly improved.

>

An iamb is a word or phrase of two syllables. The first syllable is unaccented, the second is accented.

Shakespeare's, "To be, or not to be" contains three iambs. You can feel the rhythem best if, instead of saying, "To be, or not to be" you say "didah, didah, didah." And of course, a two handled CW key has the same relationship between the paddles. One paddle is a dit, the second is a dah, and the dah is three times as long (plus or minus) as the dit, so you might say the dah is accented. So the paddles, as a set, form an iamb of code.

>Ben
>WD4MNI

Ben,

This sounds interesting. I have noticed my FT101EE lately exhibiting a similar problem. After a transmission of more than a few seconds, the rx will go deaf, then a static noise will build for a few seconds, a small pop, then the rx is back fine. Think I will check that relay tonight.

Thanks,
Phil

Chris,

I started out with a bencher and went from no code to 20wpm on it. Just recently I acquired a Brass racer and have the two hooked up on my bench. The Vibroplex seems to be able to adjust to a lighter touch (because of the magnets?) and might be a good starter. I like the tactile feel of the Bencher paddles though. To put it like the last two posts I read.. It's really a personal thing. I have been trying to figure out which one to put away for 2 weeks and still haven't. Even sometimes switch back and forth every word or so in a qso. Bottom line. Either will work... try them out at a friends or a ham store and go with the one that gives you the best initial feeling. You can always trade later on. (Hams are great traders you know :-)

The year was 1954 and I was a 15 year old pimple-faced teenage brat.

The receiver was a Navy surplus LRR-8, a 100# monstrosity with four PP Parallel 6L6's in the audio. 40 Meters was about 1/2" wide on the dial. The transmitter was a Heath VF-1 VFO driving a homebrew 6AG7 at 7 watts to a random piece of zip cord up in the garage attic. CW, of course.

Ran this set up for about a year - then finally got my ham ticket in 1955 after coaxing my code speed up to the required 13 WPM. Didn't want a novice ticket with xtal control...I enjoyed the freedom of the VFO too much.

Many thanks to the unsuspecting hams I contacted bootleg. If you have any old QSL's from (callsign deleted), name of Dudley, QSL via General Delivery, San Bruno, CA, that was me. Bootlegging on CW - how's that for dedication?

I bought one as soon as it came out. Overall, I really like it. However, I was disappointed to find out that it can not be modified to receive the 800-900 cell phone frequencies. I also have not been able to get to work with by PK12 TNC using the rear packet connector on the ft8000. I can receive OK, it sounds like am tx-ing OK, but I cant seem to connect. I have not given up yet, but I'm pretty close. If I can't get it working, I might sell the ft8000. Both yeasu and AEA tech support have been extremely worthless.

69. FT-50 Carrying

Newsgroup: rec.radio.amateur.equipment
Date: 1996-10-02 00:00:00 UTC
From: kjsmith@violin.aix.calpoly.edu
Message-ID: <52vcs4$22vl@violin.aix.calpoly.edu>
Source record: 193239

I was looking for different carrying options for my Yaesu FT-50 and pretty much ran up against a wall...until now. Just thought I'd pass this along to others that might be interested.

Yaesu has introduced a new carrying case, the CSC-V10 (~$27 from AES), which is ideal.

It's a heavy nylon case, with a clear nylon front covering the display, speaker and keypad. Holes in the cover for the speaker and mic make things nicely audible. The top is covered with a velcro flap to hold the radio in place, and there is a hole in the side for the speaker-mic (no hole for external DC power).

The belt clip is excellent. For those familiar, it's a Bianchi-style metal spring clip. It looks like it will be quite secure on the belt, but still easily removable. An ideal match.

Given the V10 in the model number, I'm almost certain that this was designed for the VX-10 commercial counterpart, but it's a welcome option. I saw a friends, and ordered one today. It's perfect.

I also called Yaesu today and asked about replacement belt clips for the VX-10 (which are rumored here to be of spring-clip type, rather than the cheapies supplied with the FT-50). They're still backordered, they're expecting them in by the end of the month, cost at around $3 each.

Hope this helps... Maybe Bee cases (they make cases for everything) will introduce a line for the VX-10 as well, hopefully with a swivel mount.

> Thanks
> Ernie
> N2OJQ

Ernie:

If your looking for a TTL to RS-232 interface, it is easy to construct
one for very little money.

I hooked my computer to my TS440S, using a spare serial card (you can
find them for well under $10) and modified it to have TTL input/output
levels. Many vintage serial cards use 1489 line receivers, and you can modify
the switching threshold to the 1.5 volt TTL level by floating the response
control pins (pins 2, 5, 9, 12, one for each of the 4 receivers). These
cards usually use 1488 line drivers. I replaced this with a quad 2 input NAND
gate TTL buffer. There was a couple of pins that I had to reroute
(5V Vcc versus the +/-12V for the 1488) , but most the pins were the same.

As far as hooking up the serial card to the 440S, here is the connections:

TS440S to RS-232

Pin 1 (GND) Pin 7 (GND)
Pin 2 (TXD) Pin 3 (RXD)
Pin 3 (RXD) Pin 2 (TXD)
Pin 4 (CTS) Pin 20 (DTR)
Pin 5 (RTS) Pin 8 (RCSD)
Pin 6 not connected.

I don't recall whether or not the TS-690 comes with the interface ICs installed
or not. The TS 440 doesn't, but the 2 specified in the manual are not too
hard to find (substitute a 71051C for the 8251C which is obsolete).

I hope that this helps.

Regards,

Don

Don't know the answer to the question since I have not tried it myself
but here is what I do know. I own both and FT-10 and an FT-50. The
connector for the keypads is different. The FT-10/40 have a short ribbon
cable making the connection, while the FT-50 has a socket that the
keypad plugs into directly. What ever style the VX-10 pad is (if it is
even one of these two styles) it will not work on both types of radios.
I suspect that since the VX-10 radios only come in a single band that
they are the same style as the FT-10/40. If this is true, then the pad
for the VX-10 could never work on the FT-50 simply because the connector
is different (unless you want to go in and change the tiny little
connectors). Any VX-10 owners out there want to let us know what style
connector the pad has?

Josh

Message-ID: <01BBB05C.4CE24E40@ip140.phx.primenet.com>
Source record: 193299

Been using a Create Products LP which covers
50-1300Mhz with some success. It was my only
6m antenna a couple years and won 1st AZ in
the June VHF QSO Party with just 10w on 6m.

Recently, I have a 5 el 6m beam, but have been
using the LP with a triplexer on 144/222/432.
Used it in Sept VHF QSO Party and made contacts
with guys around the state.

This antenna was NOT that inexpensive, but easily
passes as a TV antenna and does work reasonably
well for an antenna on a 6' boom. A very versatile
antenna that can be used for EVERYTHING...

Have read recently about some LPs that are about
twice the size and same price class. No experiences.

Obviously a set of long boom single band yagis will
outperform it, but for all band usage, plus TV and
FM broadcast recpetion, and scanning it is great!

Also "hits" many distant repeaters despite horizontal
polarization...

Have you already found a sufficient number of those caps? If
not, could you give a little more detailed description of their physical
appearance? It would save me some time if I knew that I didn't have to
look at each style of case.

Source record: 193313

Previous postings are right... you'll probably find a paddle that you like .... for a while.

Then you'll be passing by a display at a hamfest, or you'll hear an especially good fist on the air that sounds so much better than your sending, and you'll get the itch for something better.

I've been in love with Vibroplex "straight sticks" (still use one mobile... nice and heavy and takes a beating), Benchers (simple design), and even made an iambic key from a pair of J-38's back in the '60s. Currently using a Kent, because it permits a point gap of basically zero (I mean it... you can't feel the contacts closing... and it's HEAVY).... but no doubt some new key will come along and I'll have to give it a try.

Bottom line... buy something and get used to it... fiddle with it until you are as happy as you can be with it... if you feel like it can't keep up with you, test fly another one.

But stick with the CW... it's a fun mode.

We are offering a US$250.00 (two hundred and fifty dollar) reward for the first 10 (ten) examples of a specific capacitor. The item is a TRW series X682 or X683 metallized film capacitor, hermetically sealed and produced by either TRW or Goodall between about 1965 through 1975. These parts were manufactured in capacitance values ranging from .01 mfd through 12.0 mfd, with DC voltage ratings from 50 VDC upto 600 VDC. We can use any capacitance rating and any voltage rating. I can be contacted by e-mail or by calling 1-800-445-6033. Thank you in advance for any help.

Look for a bad solder joint in the pll unit. Mine was just like this but was not sensitive to the tuning control being rotated. C68 in the pll had a lead which the solder broke away from. Just seemed to be ok after the radio heated up. The cap lead was in the center of this little mound of solder and loose. This happens from the board and the lead expanding and contracting from heat over a long time I guess. If you have the resources, you can look at the pll's in order until you find the one that quits (or where maybe something closer to the tuning input). This is how I found the right one to look at.....then you have to find the particular joint with a magnifier lense.

Hi Norm,

I've had one for about a month and am happy with it. The only problem at the moment is that it is back at the shop as it stopped transmitting on the primary side. I think they are just going to give me a new one. Any way, I have had it up and running on packet with no problem, I'm using an AEA PK-96 TNC and it works fine. I don't care if it can not be modified to pickup cell or not, I don't have time to listen to that any way.

The year was 1954 and I was a 15 year old headstrong teenage brat.

The receiver was a Navy surplus LRR-8, a 60# monstrosity with four PP Parallel 6L6's in the audio. 40 Meters was about 1/2" wide on the dial. The transmitter was a Heath VF-1 VFO driving a homebrew 6AG7 at 7 watts to a random piece of zip cord in the garage attic. CW, of course. Made a lot of enjyable contacts along the West coast.

Ran this setup on 40 CW bootleg for almost a year, then got my ticket. Bootlegging on CW - - how's that for dedication? First purchased commercial gear: Used Collins 32V-2 transmitter & 75A-3 receiver in 1959.

113. Re: Kenwood 940s - Help Losing Freq Readout

Newsgroup: rec.radio.amateur.equipment
Date: 1996-10-03 00:00:00 UTC
From: MAB NY6Z <ny6z@sprynet.com>
Message-ID: <01bbb178$2274ea60$af8caec7@default>
Source record: 193179

Some 940's have been know to have a chronic "connector" problem. The cure has been to open them up, (carefully) unplug every connector you can get your hands on, and reconnect. Some kind of conductive lubricant made for this purpose probably wouldn't hurt on the larger connectors. I have cured one 940 this way. Of course you may have a different problem but this would be worth a try before you spend any money on repair.

114. F.S.: Kantronics KPC-4 and KPC-3

Newsgroup: rec.radio.amateur.equipment
Date: 1996-10-03 00:00:00 UTC
From: George Daniel <danielg@avana.net>
Message-ID: <01bbb17c$92d4c7e0$8a85f5cd@danielg>
Source record: 193180

Hello Everyone,
I have a Kantronics KPC-3 and 4 for sale. BOth are in excellent shape and neither were used more than a few months. KPC-3 is plain ol' VHF TNC of course. KPC-4 is a simultaneous dual port 1200 baud TNC. Perfect for a gateway from one VHF freq. to another.

KPC-3.....$75 shipped

KPC-4.....$125 shipped.

Please call 770-487-0208 or leave Email : danielg@avana.net

73,
George

I've had my Sony 2010 for about 8 years and I, too, wouldn't trade it.
Not only does it serve me well as a shortwave wave receiver, but also as
a clock-radio. It wakes me up every morning to music on my favorite local
FM broadcast station! It also happens to be one of the easiest radios to
operate and program.

Try it. You will like it!

73, Jim

120. Re: Wanted - specific capacitor

HI... I have had a Sony ICF-2010 for about 3 years now and the radio
works great...especially if you hook it up to a dipole or other external
antennas. The receiver is great...no problems with the radio what so
ever.. The batteries last a long time too... (use alkalines)

Ken

I have a Toshiba T3100e portable 286 based PC that is in a cast metal case that is very quiet as far as RF generation. I you would like to use a PC right beside your rig, this will do very well. It has the orange pasma display and can directly drive an external ega colour monitor too.

I have DOS and WINDOWS loaded along with the HamCom shareware, and the full set of Toshiba manuals. All in excellent condition.

I am looking for about $300 Canadian (~$215 US) or trade for amateur gear or test equipment, especially a logic analyzer.

133. Thanks for the paddle advice

Newsgroup: rec.radio.amateur.equipment
Date: 1996-10-03 00:00:00 UTC
From: cdorn@gpu.srv.ualberta.ca
Message-ID: <52v9iv$12a2@pulp.ucs.ualberta.ca>
Source record: 193246

Hi,
Thanks to all for the great feedback on the various keyer paddles. I managed to finally get to the local Ham store here, to see what they had kicking around. I tried the Bencher BY1, the Vibroplex Brass Racer, some other Vibroplex paddle (can't remember at the moment - too expensive), and the MFJ economy paddles. I found the Bencher to have the most smooth, and positive feel. At least that was my initial brief impression. If I buy a new paddle, I think the Bencher will be the one. If I can find something used at a great price, I would try something else.
Thanks again,
Chris VE6RDC

135. TS790 lose sensitivity when warm

Newsgroup: rec.radio.amateur.equipment
Date: 1996-10-03 00:00:00 UTC
From: Jean-Luc BARRAUD <f1jek@amsat.org>
Message-ID: <3253E328.7FCD@amsat.org>
Source record: 193248

Hi,

When a given signal is at, for example, S9 in UHF when my TS790 is cold,
the same signal is measured 53-54 when the unit is warm (after some hours under power
or some transmissions). If this is only a S-meter drift, it's not very important,
but I'm afraid that it could be a real loss of sensitivity, this has been told to
me by a "DL" ham who can't do 9600bps sat when the unit is warm (hot !!!) due to
weak signals. I wonder if somebody else has seen this on his unit...
For your information, units made before 1990 must be modified for the fan-motor
to operate correctly. On mine, one of the wires of the motor was cut inside. So, since
3 years, my fan-motor has never turned !!!

Allen-Bradley AB and Ohmite type J industrial pots are very high quality
items. They use, I think, a graphite brush for a wiping contact on
composition elements, rather than a metal brush on a deposited carbon
element.

HP and Tek gear uses these. Need I say more?

>'73 de Russ, KI8J

Russ,

You can only store odd offsets and CTCSS tones in memory channels 7,8,9 and 0.
menory channels 1,2,3,4,5,and use memory channel 1 for the master. So what
ever you do in memory channel 1 it is the same for the other 5. If you change
a CTCSS tone frequency in Channel 2 then all channels 1 thru 6 will not have
the same tone. The IC-02AT was designed this way.

The December 1992 issue of 73 magazine has an article by John Rehak, N6HI titled "Iambic Keyer Paddles: A wide array of choices". While it's becoming dated (some of the manufacturers listed are no longer in business) I think it's still a useful reference piece.

But keep in mind there's no substitute for actually using a paddle before buying it!

I have been using a 2010 for several months now for casual listening.
It works very well indeed, considering it's a portable and that I'm
using the built-in whip antenna almost all the time. I mainly bought
it to listen to the BBC World Service and some other stations, plus to
listen to aircraft traffic and such. Works very well. Wouldn't trade
it for anything.

From: Wes Shull <shul9478@uidaho.edu>
Message-ID: <32540C89.BFC@uidaho.edu>
Source record: 193266

I was just reading the October QST, and noticed that Standard's got a new 2m HT out, the C156A (or at least they're advertising it; I guess that doesn't mean it's out yet).

Anyway, it's looking rather nice, and I'm considering it for my first HT (been licensed since March now, and still no radio!). I was just wondering if anyone has had a chance to actually play with this model, and if so what your thoughts are on it. I know Standard's got a reputation for having the best intermod immunity, but I don't know how the other aspects of their radios shape up. I don't know any hams that own Standard gear, but then again I don't know many hams. (once I actually get on the air, that should change)

Anyway, if anyone has any comments, please post them here so that everyone can benefit from the information.

Check to be sure tone squelch has not been turned on for
the memory channel holding the repeater frequency. Also check to be sure
the repeater trustees have not turned on tone squelch at the repeater
(in which case you would need to set the HTX-202's tone squelch to the
same setting).

George,
I have had my DJ191 for about 3 months and am very pleased with it.
It has a slight intermod problem when using a high gain base antenna,
though I think this is true with most HT's. No problem when using a
mobile or the rubber duck antenna. I think it has good
performance/features for the money.

>> do this, ...

Maybe *most* but not *all*. The Kenwood 732 and 733 have a mute feature that,
if selected, mutes the band not in use during receive and transmit. Say the
operator *selects* 2m as the main band and is listening to a QSO, if a call
comes in on 440, then the 440 side is muted. If you're xmitting on 2m and a
call comes in on 440, the 440 call is muted. The operator can select 440 as
the main band in which case the process is reversed. How do I know this?
Well, I own the radio.

The ones I've purchased from Mouser Electronics have worked fine for me.
Check out http://www.mouser.com. They have ones that are straight and
right-angle. The right-angle version has presented some problems with
various rubber duckie antennas. Price per was on the order of $1.30,
less for 10 or more. Not sure if the minimum order policy is still in
effect or not. Call and ask!!

I just performed the 800 MHZ receive mod on my Z1-A.
It involves adding 2 UN-9110 surface mount components to the
2F board which is quite a chore to remove.

$70 may be a good deal for someone else to do it.

If you do it, the following is necessary:

1) Z1A Service Manual for $39.00. It shows how to
remove the 2F board.
2) 2 UN-9110 components (the schematic refers to
a UN-9115 but that is not available from Icom).
3) The ability to solder the very TINY UN-9110 to
the board (they are about the size of a pencil point).

4) You're on your own - don't even think of asking ICOM
for any help on this or mention of this mod may invoke
wrath that you will deserve w/o mercy.

The quality of the 800mhz receive is far better than that
of my Uniden scanner.

good luck.

Kenwood TS-530S HF Rig for sale in mint codition, Serial Number 3030227. Will operate 160-10 meters including WARC bands. I am the original owner, nonsmoker. Radio has optional cw filter installed, YK-88CN, and comes with the MC-30S hand mike, and manual. $525, shipping included COD. As a backup rig, radio has been used 5 hours in five years, and hardly used prior to that. I must raise money for 6 meter duplexer. 201 765 0919 or email. ka2qep@webspan.net 73, Ka2qep, Bill

Howdy --

NOT taking a page from the ICOM book (advertising and "introducing"
the '706 for a year), the Kenwood TS-570 has hit the stores today...
no cut sheets just the rig.

I only played with it for about 15 minutes but I was very favorably
impressed. If memory serves it was priced at around the $1300.00
mark. It's about the size of an IC-735 or a little smaller, with a
good but not great DSP built in (although to give them their due it
usually takes a while to get to know a DSP... when and how to use
it). Comes with a 300Hz CW filter which was to die for... you'd
never need another.

The menu selections were so long I never got to the end of them, I had
to run,. But every "why doesn't this rig enable ME to select ..."
that you've ever heard about any rig in the world this things got.

Overall for the money I was very favorably impressed (RS-232 socket
on the back). And it was all I could do to keep from walking out of
the store with it!

I've owned a TenTec Paragon and now have the IC-706 (with outboard
DSP) which I'm not about to give up but I'm definitely going back to
that store to play some more.

Looking for mods for this unit *particularly*.

This was made as an export model, and actually has 360 channels rather than just 120 (AM+USB+LSB) -- a set of 40 each above and below the "CB", plus it has a CW mode as well. I think it would make a very interesting jump-off point for mods...

Yaesu FT-5100/FT-5200 MODS
Rev D (11 June 1993)

This is a collection of hardware and software mods for the Yaesu
5100/5200 pair. I have the 5100, so I can't verify these for the
5200. I have collected every mod seen on the net (ie. Usenet) since
the introduction of the 5100, so I think this list is fairly complete.
I am interested in getting updates and corrections to this list, so
please send me e-mail if you find something that needs updating.
(This includes typos, wrong or missing attributions, caveats, warnings
about unmentioned side effects, serial numbers of radios that won't do
some of these mods, etc.)

SOME OF THESE MODIFICATIONS MAY DAMAGE YOUR RADIO IF YOU PERFORM
THEM IMPROPERLY. WHEN IN DOUBT, DO NOT PERFORM THE MODIFICATION.

This advice is free, so remember that you get what you pay for.

Brian McMinn (brian.mcminn@amd.com)

-=-

General Review (5100):

Since Yaesu's advertising has already made the good points known, I'll concentrate on the warts and shortcomings.

Dual In-Band Receive: works as advertised except for sensitivity. The "main" receiver works very well. The "sub" receiver works very well when tuned to the opposite band from the "main" receiver. When tuned to the same band, the "sub" receiver suffers from slightly lower sensitivity in the ham bands and greatly reduced sensitivity out of the ham bands.

There is a 2m VCO/PLL/IF and a 70cm VCO/PLL/IF. I assume that dual in band receive is done with the opposite band's receiver. This would explain the poor sensitivity, but it sure raises some questions about how the duplexer works.

I expected a type "N" connector, the radio came with UHF.

Control wart: (are you listening Yaesu?) You can only transmit on the "main" (ie. left) side of the radio. When both 2m and 70cm receive are active, you change bands with the "BAND" button. This swaps the left and right displays. When dual in-band receive is active, the "BAND" button changes both the main and sub receivers from 2m to 440 or from 440 to 2m. Arrrgh!!!! I would prefer a "SWAP" button to swap left and right regardless of mode. (The "SUB" button is used instead.)

Automatic backlight dim: works as advertised but the backlight level under low ambient lighting is WAY too low. Manual control is the best solution.

DTMF page: works as advertized, but the *&%$#@ thing insists on "ringing" like a phone EVERY time it receives the page sequence. This means that you have to co-ordinate with the other station to turn the *&%$#@ DTMF stuff off at the same time or tolerate the "ring" at the start of every receive.

CTCSS decode: squelch opens quickly when normal CTCSS decode (an option) is enabled. There is a CTCSS page function that has a distinct delay between receipt of carrier with CTCSS and open squelch. I don't yet understand the use of this "feature."

There is no SCAN button on the front panel. Scan is initiated by holding the up or down button of the mike down for two seconds. The scan is blindingly fast when compared to the

Alinco 590 that I used to have.

Memory: memory is divided into four "banks." Two for VHF, two for UHF. Only one bank can be active for each receiver. I consider this an advantage, but you may not. There are two obvious (to me) uses for this configuration. First, you can store frequencies for different uses in different banks. Second, you can activate one 2m(440) bank in the main receiver and one the other 2m(440) bank in the other receiver and scan them simultaneously.

Heat management: After seeing the HUGE heat sink on the back of the Alinco 590, the Yaesu 5100's sink seems too small. In a key down experiment, the heat sink of the Yaesu got almost too hot to touch before the fan kicked on. If I were planning to run a packet station, I would definitely look into some extra forced air over the back of this one. As it is, I'm a bit concerned about how hot it will get mounted in my dashboard. [Others people don't seem to have this problem.]

DTMF Decode and Scan: If you have CTCSS decode (an option) enabled on a memory and you are scanning and there is activity on that frequency but without the correct CTCSS tone, the 5100 stops scan, flashes the strength meter and then continues scanning. It is slower than normal scan, but still quite fast.

Attributed: Brian McMinn, N5PSS, brian.mcminn@amd.com

-=-

Backlight Control:

Effect: manual control of backlight

1) Hold down the MHZ key and turn radio on
2) Use tuning knob to adjust brightness
3) When FUNC is active, the tuning knob will adjust brightness again.
4) You can restore automatic control by repeating step 1.

Notes: Manual is fuzzy on this feature.

Attributed: Yaesu

-=-

Crossband Repeat (reported as working on 5100 and 5200):

Effect: Enable crossband repeat

[ed -- Note that there is a 5200 specific crossband mod that appears later in this list -- I don't own a 5200, so I can't test either. This key sequence works on my 5100.]

1) Dial up two frequencies you want to crosslink (be sure to pay attention to transmit offsets, if any)
2) Turn radio off.
3) Hold down the RPT key and turn radio on

Result: The tone encode/decode flags and the -+ flags will be flashing and the radio will be in low power mode. When either band's squelch opens, the other band is moved into the primary frequency display and the transmitter keys. Audio link appears to be speaker to mike.

Exit crossband repeat mode by repeating steps 2 and 3 above.

Attributed: Yaesu

-=-

Transmitter Timeout:

Effect: automatically limit transmitter "on" time

1) Hold down the HIGH/LOW button and turn radio on
2) Use tuning knob to change the number in left VFO. This number is number of minutes for the timeout timer. The factory default appears to be 15 minutes.
3) Transmitter shuts off with "Err" displayed in VFO if the time limit is exceeded.

Attributed: Bill Mayhew, N8WED, wtm@uhura.neoucom.edu

-=-

Tech Manual:

The technical manual for the 5100 is [information wise] pretty spare. No additional operating notes or hidden secrets are revealed. It is worthwhile for the alignment notes and complete parts list. Call the number in your owners manual to order.

Attributed: Bill Mayhew, N8WED, wtm@uhura.neoucom.edu

-=-

DTMF decoding:

Effect: display decoded DTMF tones

Note: [ed] this works on the FT-530, but not on my 5100. I'm including it here on the chance that it works on the 5200. Please try it on your 5200 (or 5100) and tell me if it works for you.

1) Select frequency and turn on the code squelch
2) Press Function-Page(Code) to select a code memory
3) Dial up to memory #7 [the 5100 won't do this]
4) Watch the dtmf's scroll by as they are heard by the radio!

Attributed: jmeyers@ecst.csuchico.edu (Jeff Meyers)

-=-

Crossband Audio Enhancement:

Effect: unmuffle crossband audio

Connect a 27K ohm resistor between the audio-in and audio-out leads on the data jack (inside the shell of a mini plug, that is). The mic element stays live while in crossband operation. It is a good idea to remove the mic from the rig while cross banding if you need/want to eliminate ambient audio.

Attributed: Bill Mayhew, N8WED, wtm@uhura.neoucom.edu

-=-

Wireless Mike (review):

The wireless mike sends audio over 49.85MHz, so it is can't be used in high RF environments (like near computers). It duplicates ALL front panel controls with the exception of the power button.

It interfaces to the rig via a standard mic plug. The receiving unit is only about 1'h x 2w x 1/2d.

[ed] The implications of this are that the entire radio can be controlled via the microphone port! Too bad there isn't a fancy *wired* mike with all the controls on it.

Several people have reported trouble with the mike -- enough trouble for them to return it because of poor range and poor audio. It works well if you sit on top of the pickup unit, but then you don't need a wireless mike.

Attributed: Tony Pelliccio, KD1NR system@garlic.sbs.com

-=-

The "P" Key on the microphone:

I was curious about that "P" key on my FT-5100, so I called Yaesu and they explained the situation. They designed the the mic to accommodate "future products". The "P" key is there to be taken advantage of at a later date by other models. They just did not want to re-design the mic again within a short period of time.

Attributed: Will Collier, KB5WRK, COLLIER@gallant.apple.com

-=-

Expanded Receive (5100):

Good Effect: enable extended receive coverage
New range: 128-180MHz and 420-475MHz
Bad Effect: disable automatic repeater shift selection.

Warning: This mod does not apply to the FT-5200 as the design
is somewhat different.

Warning: You must have a very steady hand or else! A
magnifying glass would help too.

1) Disconnect DC Power cable from radio. ALWAYS!

Caution NEVER TRY TO TAKE APART (DISASSEMBLE) THE FRONT
CONTROL HEAD. It will void your warranty.

2) Remove (6) screws from Top Cover of Radio and (6) screws
from Bottom Cover of radio.
3) Remove Top & Bottom Covers from Radio (Be careful of speaker
falling out).
4) Remove the (2) silver screws on each side of the radio
holding front control head to main body of radio.
5) Carefully pull away (a few inches) the Control Head from
the radio body. CAREFUL with the Ribbon Cables.

NOTE There are no numbers on the circuit board so you will
have to match up with the diagram below.

6) On the rear of the Control head locate, Unsolder and remove
jumper Pad R4072.
7) Solder across jumper pads: R4070 R4068 & R4064 (use wire or
0 Ohm resistor)

NOTE If you want to change the D/MR button on the
microphone to do Band Switching, now is the time.
See the next mod.

8) Install front control head, speaker, top and bottom covers
and reconnect power to the radio.
9) Press and hold [D/MR] [F/W] [REV] keys and turn on the radio.
Radio will now show 300.000 & 20.000 on display.
10) Set UHF Rx Low - Press [MHz] and dial 420.00, press [D/MR]
11) Set UHF Rx High- Press [MHz] and dial 475.00, press [D/MR]
12) Set UHF Tx Low - Press [MHz] and dial 420.00, press [D/MR]
13) Set UHF Tx High- Press [MHz] and dial 450.00, press [D/MR]
14) Set VHF Rx Low - Press [MHz] and dial 128.00, press [D/MR]
15) Set VHF Rx High- Press [MHz] and dial 180.00, press [D/MR]
16) Set VHF Tx Low - Press [MHz] and dial 140.00, press [D/MR]
17) Set VHF Tx High- Press [MHz] and dial 150.00, press [D/MR]
18) Set UHF offset - Press [F/W] then [RPT] dial 5.000 press [RPT]
19) Set UHF tuning - Press [F/W] then [REV] dial 25.0 press [RPT]
20) Set VHF offset - Press [F/W] then [RPT] dial 0.600 press [RPT]
19) Set VHF tuning - Press [F/W] then [REV] dial 20.0 press [RPT]
(VHF tuning step varies by state -- many use 15.0)

Diagram: [there are no tabs in this section - ed]

Ok, here's where it gets tricky, but so you know, a '|'
represents a jumper.

-=-

Band Switching or Tone Burst via D/MR button on microphone (5200):

Effect: change function of D/MR button on mike.

This is based on information from Yaesu in Japan.

The functions of pin 5 (the microphone button) can be altered by changing jumpers in the control head. To find these jumpers, see the section on packet radio in the ordinary instruction book.

Control Head Jumper No
Pin 5 Function Closed Jumper Marked By X
1 2 3 4 5
D/MR X
Band X
1750Hz Tone Burst X X
Main band Busy Out X
Sub band Busy Out X
Call Channel X X

Main / Sub band busy out - When open SQL = 5 Volt DC
Closed SQL = 0 Volt DC
[ed - I'm not sure what this means since I don't own a 5200]

Attributed: John Newgas, G7LTQ jnewgas@cix.compulink.co.uk, g7ltq@g7ltq.ampr.org

-=-

Mute Level (5200):

Effect: [ed - I'm not really sure]

See above for location of jumpers, etc.

Mute Level Selection 1 2 3 4 5
No Mute
Minimum X
Middle X
Maximum X X

Attributed: John Newgas, G7LTQ jnewgas@cix.compulink.co.uk g7ltq@g7ltq.ampr.org

-=-

Crossband Repeat (5200):

Effect: crossband repeater
Bad effect: CTCSS function is lost

[ed -- there is another crossband mod in this list...]

This is based on information from Yaesu in Japan.

These jumpers are located in the main radio case. For
location, refer to the FT5200 Technical Guide.

1) Remove (open) JP5017 on the interface unit
2) Press and hold PRI button while switching on the power.
3) The FT5200 will now work as a cross band repeater.
4) The CTCSS function will be lost.

Attributed: John Newgas, G7LTQ jnewgas@cix.compulink.co.uk
g7ltq@g7ltq.ampr.org

-=-

Extended Frequency Range (5200):

Effect: set receive and transmit range.
Bad effect: ARS gone.

This is based on information from Yaesu in Japan.

These jumpers are located in the main radio case. For
location, refer to the FT5200 Technical Guide.

1) Close (short) JP5001, JP5002, JP5003, JP5006 and JP5007
2) Remove (open) JP5004 and JP5005

The frequency range possible will now be approximately :
VHF Rx 110 - 180 MHz Tx 130 - 180 MHz
UHF Rx 330 - 480 MHz Tx 425 - 465 Mhz

The radio's alignment was done at the factory for your
original frequency bands and so there will not be optimum
behavior outside these ranges. Broadening the alignment will
sacrifice performance at usual frequencies. In practice, the
alignment does not need adjustment.

You can program the frequency limits now. [ed - note the
similarity (and dissimilarity!) to the 5100's program-limit
sequence above]

3) Press and hold [D/MR] [F/W] [REV] keys and turn radio on.
4) Program in VHF low edge of Rx
VHF high edge of Rx
VHF low edge of Tx
VHF high edge of Tx
5) Repeat for UHF in the same order.

I [John] have not done this so I can give no further advice on
programming.

Attributed: John Newgas, G7LTQ jnewgas@cix.compulink.co.uk
g7ltq@g7ltq.ampr.org

-=-

Extended Frequency Range (5200):

[ed - yes, there are two mods and I include them both since
they are so different in style (and perhaps content).]

Effect: set receive and transmit range.
Bad effect: ARS gone.

The following explains how to expand the receive and transmit
frequency range of the Yaesu FT-5200 and how to enable the cross-
band repeater operation.

All the modifications are carried out on the interface board and
involve removing or adding links on jumper spots.

You will get considerably increased receive and transmit
coverage; however, you will lose the Automatic Repeater Shift
(ARS) feature. You may think this is an acceptable price.
Finally, it should be obvious, but during this procedure you
will obviously lose any stored memories.

1) Remove the control head and set on one side
2) Remove the upper and lower covers on the main chassis. For
convenience, remove the speaker, noting which way the two
pin pcb connector is oriented. [ed -- does it matter?]
3) Remove two side screws holding on the front of the chassis
and remove chassis front. (The chassis front is the
surface with the contacts for the control head.)
4) Locate a double row of ten by two jumper spots, numbered 1
to 20. The jumper configurations will depend on the area
for which the rig was intended. Note the arrangement if
you ever want to un-modify your radio.
5) Using a fine-tip soldering iron, set the jumper spots as
follows:

1 closed
2 closed
3 closed
4 open
5 closed
6 closed
7 closed

6) This completes the alteration for frequency expansion.
Reassemble the radio.
7) Reinitialise the radio by simultaneously holding D/MR, F/W,
REV and POWER. You must now program in the band limits.
The display will show a blinking "1" in the left-hand
memory box and "000.000" in the left-hand frequency
display. (Ignore the right-hand display for now). The
following limits are suggested, but the RF circuitry of the
rig will only cover slightly less. Use the dial or up/down
buttons to select the frequency and then press D/MR to
store it. The blinking "1" will increment.

VHF rx: 137.000 174.000
VHF tx: 137.000 174.000
(display will show blinking "1" and "300.000")
UHF rx: 410.000 470.000
UHF tx: 410.000 470.000

(Note: it is possible to set the RX limits wider than the TX limits; for obvious reasons you cannot have the reverse situation).
8) You can repeat step 7 above at any time if you need to change the limits.
9) The pre-set repeater offsets are now no longer available and you will have to set them up manually using the instructions on page 16 of the manual. The Automatic Repeater Shift (ARS) feature (also on page 16 of the manual) will also have disappeared and you will have no way of getting it back (except by changing the jumpers back).

To enable the crossband repeat, remove the link at jumper spot 17. (Note, just below jumper spot 17 is a separate jumper spot, not part of the group of twenty - leave this alone).

Attributed: Hugo Cornwall

-=-

Cross Band Repeater (5200)

Effect: enable crossband repeat

[ed - this is a continuation of the above]

1) You can enable the crossband repeater without altering the frequency coverage. The only hardware alteration is the removal of link 17.
2) To enable, turn on rig while holding down [RPT] button. The rig is now a crossband repeater - you will get confirmation of this from the display: the 100s position on the two frequency displays will be replaced by a "R".
3) While in cross-band repeater mode you can change the frequencies of each band.
4) The crossband repeater suffers from desense. It works better at low power and even better if you use an external diplexer and separate antennas. The more isolation between the two bands, the better. As with all cross-band repeaters, results will be poor if the UHF frequency is a direct multiple of the VHF frequency. If you are planning extended use of a crossband repeater, make extra sure that the rig is adequately ventilated.

===

Remote Control Mike Interface (5100, maybe 5200):

Effect: remote (wired) control of radio

The Remote Control Mike (from Yaesu) uses a serial data stream interface in the microphone jack to control the 5100. This simple hardware interface allows a computer to control the 5100 in the same way. It is somewhat similar to the CAT interface I have built for my FT-757 HF rig, but mostly like the interface described in the FT-912R manual (loaned to me via a friend from Yaesu). When using my PC as the source for the serial data, I used a MAX232 chip for a level conversion between the +/- 12 volts levels on the computer and the 0-5 volt levels on the radio.

The serial data parameters are 4800 N82. The commands sent to the radio are simple one byte instructions. The RMC mode ON command (16) must be sent before any other command. When the RMC mode is ON, a small LCD "RMC" icon will light on the display (see owners manual under Display). Also, the Vol, Sql, and Bal knobs are disabled when in the RMC mode because they will be controlled via serial commands, but all other buttons are still active.

The commands are as follows:

0 - RPT 12 - CALL 24 - SQL Up
2 - REV 14 - BAND 26 - VOL Up
4 - MHZ 16 - RMC 28 - BAL Right
6 - D/MR 18 - SUB 30 - BAL Left
8 - TONE 20 - PAGE 32 - SQL Down
10 - LOW 22 - F/W 33 - VOL Down

The interface I built simply wired mike port pin 7 to serial ground and pins 1 and 3 each through a diode then together, to the serial source. Note: I am not a hardware person! Use this hardware at your own risk.

```
+----1 7------------- GND
| 2 8 6 (These can be connected to a MAX232
| +--3 5 +-+-------- SER IN or the FIF-232C pins 1 and 3)
| | 4 | |
| +--->|---+ |
+----->|-----+
```

You can wire 1 and 3 together first, then through 1 diode, but that disables the UP and DOWN buttons.

I'll continue to study this more. If anyone would like to know more, or has any corrections or feedback, please email me.

Attributed: Byon Garrabrant, KD6BCH byon@csulb.edu

-=-

[end of mod sheet Rev C]

-=-

Wireless Mike Problem:

Effect: Unexpected/Undesired Transmission

The wireless mike will pick up any transmission in the 49MHz range (including cordless phones and baby monitors) and re-transmit them on the ham bands. Don't leave your radio on and unattended with this option installed.

Attributed: kenh@w8hd.org (Ken Hoehn)

The Fix:

There's a modification for the MW-1 that will only let the radio key up when it receives both the 49MHz signal and an infrared command from the MW-1 remote. I think they list it in the users manual for the MW-1. [ed. with this enabled, some have complained that the transmit is intermittent.]

I just saw one today at Ham Radio Outlet in Atlanta, GA. I only played
with it for a few minutes but I think it has sold me. Think I will go
back tomorrow or Monday and get one. Below is a copy of the Kenwood
Bulletin that they copied for me at HRO.

SALES BULLETIN
TS-570D pricing
September 30 1996
S-96-52-A

AFFORDABLE DSP IS HERE WITH THE NEW TS-570D
Kenwood Communications proudly announoes the new TS-570D HF
transceiver with
DSP at an affordable price. The TS-570D represents a new era in HF
radios from
Kenwood in tenns of performance, styling, and operating ease. Worid's
first CW Auto
Tune eliminates VFO adjustments during CW operation. Scrolling menu
system
appears on the large LCD display offering the operator simple control
of 46 types of
functionS. DSP noise reduction is activated at the touch of button.
Eliminating ORM is
easy with slope tuning and selectable IF filter bandwidth. High speed
computer oontrol
up to 57.600 bps Is possible with an easy connection to the RS-232

com-port. Radio
control softeware program Included. Look at all the Features.

* 16-bit DSP TECHNOLOGY * Worid's First CW Auto
Tune
* Noise Reduction for CW and SSB * Slope Tuning
* TX/RX: 160-10M Amateur Bands (100W) * RX: 500KHz-3OMHZ
* Voice/transmit equalizer * Quick Memory
* New "soft touch" keys * Dedicatad Packet Port
* Large LCO display * Speech Processor
* Automatic Antenna Tuner * Full Featured Scanning
Capabilities
* 10-key Direct Frequency Entry * CW Reverse Mode
* Electronic Keyer 0-100 WPM * CW Message Memories
* Variable 5 to 100 Watt
Power Qutput
* FuIl Break-in and Semi Break-in * RS-232 Com-port
* 2 Antenna Ports
* YK-88C-1 CW FiIter (500Hz) Option * YK-88CN-1 CW Filter
(270Hz) Option
* YK-88SN-1 SSB Filter (1.8KHz) Option * 100 Memory Channels

>>First, energy from the rubber-duckie antenna gets into the radio's
>>power leads.

I have NEVER had that problem with my two HTX-202s that were
manufactured in 1994. Have -you- experienced this phenomenon
FIRST-HAND, or are you simply repeating someone else's post?

>>...the HTX-202 may be unreliable for use with an autopatch.

I have NEVER experienced ANY problem accessing autopatches with my two
1994-era HTX-202s. I have seen an easy-to-perform adjustment text for
this situation - but, again, have YOU experienced this problem
first-hand?

Are these really problems for the current crop of HTX-202s? Or are we
simply re-posting age-old problems from 5+ years ago?

182. MFJ HI-Q LOOP ANTENNA

Newsgroup: rec.radio.amateur.equipment
Date: 1996-10-04 00:00:00 UTC
From: k5rov@juno.COM
Message-ID: <19961004.104946.8063.0.k5rov@juno.com>
Source record: 193145

I guess its kind of late to ask this question, as I have already ordered the MFJ loop antenna. However, they give a 30 day trial period, so I guess I could return it, if necessary.

I am required to go to the hospital in San Antonio pretty often. When we go, we usually stay in the guest house at Lackland Air Force Base. As the tests are fairly painful, I usually keep my mind busy by listening to CW on my Yaesu FT-890, while waiting. I operate 95 percent CW.

I have tried stringing wire around the room, but there is very little space. The military has very strict rules about stringing wires outside the building. I would love to be able to get on CW while I am there, at least on 20 meters.

I would like to hear from anyone who has experience with the MFJ Super HI-Q Loop, pro or con. Will it work? The AEA loop is a bit out of my financial range....retired you know. I have been hamming for over 50 years, but have never used anything smaller than trap dipoles up in the air, other than mobile whips.

Thanks for your help, best 73, and God bless.

: ("I got a traffic safety good-luck charm at the shrine.")
: -- example sentence from my Japanese-English dictionary

I own two pieces of Standard gear--the C558a dual band handheld and
the 5718a dual band mobile and I *really* like them. I wouldn't
trade them for anything. They're extremely
well built, extremely elegant software design (esp the 558a), and they
produce some of the best quality audio I've ever heard on transmit and
receive (and I'm extremely picky about that sort of stuff too). I guess
this doesn't directly help you with the decision on the C156, but I know
personally I wouldn't hesitate to buy more Standard gear.

Hope that helps...

You can also use a MGF1402 - probably cheaper and easier to find, Down
East Microwave sells them. Microwave Components of Michigan used to
also but I saw a post recently that said they were out of business.
Not surprised - I ordered from them a year or so ago and it took
months and several phone calls to get the parts.

193. Re: Ham Repeater w/ 2 Motorola Radius?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-10-04 00:00:00 UTC
From: conklin@forbin.com
Message-ID: <3254a0f8.5020757@news.uni.edu>
Source record: 193204

On 2 Oct 1996 19:13:39 GMT, mbrinkho@falcon.inetnebr.com (Matt C. Brinkhoff) wrote:

>I've got 2 Motorola Radius mobile rigs (one is a D34LRA7PA5CK, the other is >a D44LRA73A5CK) that I would like to make in to a Ham-band 440 repeater.

Both are UHF - the D34 is a 25 watt unit, the D44 is a 40 (45?) watt transmitter.

>Can anyone tell me:
>
>1) What exactly these radios are (I'm fairly sure that they are both UHF)
>
>2) Is there a controller I can use to "plug and play" with these radios >(other than the Motorola commercial one)

"almost TTL" level COR is available INSIDE the radio, I used an external pl decoder when I fudged one as a temporary repeater receiver once, so I don't know about what signaling is available for PL decode activity indication.

Inside the radio if you are not scared of soldering to some SMC IC's, you can get a decent transmit audio point, and a nice 2v p-p receive audio point that is squelch muted, stripped of PL, and de-emphasized.

If this is PnP, then o.k.- but there is no satisfactory way to interface this radio without doing some fine soldering to the system boards.

>3) Any experiences, comments on using these radios in repeater service.

Good audio, like all Circle-M radios should have. Poor squelch circuit, at least compared to Micor/GE Mastr II - at least it doesn't chop up mobile fluttering signals, but it does have a rather long mute attack time (lots of hissssss... at the end of receive).

The reason these radios are great for radio shops that want to sell volume makes them poor for base/repeater use: there is no front end to them. Don't even think of putting next to a large transmitter- don't even think of putting a preamp on it- don't expect to hear handheld users beating out the paging system 10mhz away if this radio is placed in a high-RF environment.

The Motorola Radius GM series repeaters are decent for what they are designed for: low-power, low-sensitivity, very localized portable/temporary use. As for the mountaintop repeater wanting to cover a 50 mile radius .... forget it.

Amazingly (I was surprised) to be next to a friend buying one at Radio
Expo last month, where the dealer offered to "open up the receive - so
you get all of 800Mhz" for the unbelievably low price of $50.
Needless to say I suggested my friend bypass such surgery as either A)
bogus, and ineffectual, or B) terribly overpriced for what usually
turns out to be something simple.

O.K. people- is there such a mod, or was the "Ham radio dealer" (I use
the term loosely) just offering to lighten up people's wallets.

Josh hasn't tried his yet, but I noticed looking through the book that
the rxd and txd pins are common to either baud rate, and software
selectable. Make sure your radio is set to 1200bps mode (sorry if
this is too obvious and already attempted)- otherwise no wonder it
doesn't work- your high/low tone deviations are not in sync with
everyone else's pre-emphasized/de-emped audio.

Hello!

1. Why it is not recommended to use recahrgeable batteries in FT50:s battery pack (FB15)?
Only dry cells are recommended.

2. May I use full power TX by using 13.8V from cigarret lighter etc

-so that battery pack is empy or taken away?
-or to charge original battery pack (FB 40/41)?

3. If I charge with 13.8V, what shall be the time instead of 15h with standard charger?

>but still would like to get this one working again.

A very common problem that occurs with the HTX-202 (but gets very little newsgroup coverage): The wire leading from the PC board to the BNC antenna connector breaks due to flex stress. When your antenna is wiggling around on top of the BNC antenna connector, a small, STIFF wire attached to the center pin wiggles as well. Over time, the stress is too much and the wire breaks. THE RADIO WILL APPEAR TO BE FUNCTIONING PERFECTLY. Of course, no one can hear you. Solution: replace the wire.

Be warned that I do not recommend opening an HTX-202, especially to perform this repair, unless you ABSOLUTELY know what you are doing. If you are unsure, find someone to help you. The best place to check is at a ham club meeting. A word of warning: If the only soldering equipment the person about to open your radio posesses is a propane torch and a 200 Watt gun, don't let him touch it!

Hi Chris-

I have a Bencher, a Vibrokeyer, an MFJ, and several bugs, and of all the paddles, I like the Vibrokeyer far and away the best. It has the best feel, and I can send with fewer errors with it.

I should tell you though, that I don't use a keyer 100% of the time. I use a keyer about half the time and a bug the other half. Matter of fact, I keep a bug and keyer wired parallel on two rigs, so I can switch instantly between them.

The Vibrokeyer is very very similar to a Vibroplex bug in feel, and that may be why I like it so much.

Hey....get yourself a paddle and fire up that keyer! A long session with a straight key is WORK! <g>

201. IC-490A Repair.... Help needed

Newsgroup: rec.radio.amateur.equipment
Date: 1996-10-04 00:00:00 UTC
From: ke4qiz@iu.net
Message-ID: <532bk4$4jo@cc.iu.net>
Source record: 193212

I'm having a problem with a 70 cm radio and was looking
for some help. It's an ICOM 490A 70 cm all-mode. The
A-B VFO switch does not work. I've checked the switch
itself and it is ok. I've also checked the wiring
from the switch on the front control panel to the main
board were the microprocessor is located, this is also
ok. The clock signal 03 from IC4 pin 15 is getting to the
processor line A0 ok when the A-B button is pressed.
It also will not write to any memory channels, so I
thought maybe it was stuck in the B VFO. The manual
says that VFO A must be used to write to any memory
selection. The unit transmits and receives fine in all
modes and will auto scan up or down and manualy tune
using the present VFO. Is there something else I can
check? Is there a way to tell which VFO it's realy on?
If someone has broken unit that does not xmit or rcv
but seems to program ok I may buy it for the micro-
control unit. If you can help send me a note or call
and I will call you back. Mitch-KE4LQF (407)388-0831.

This fron my friend Mitch. He is working on my radio and
is not able to post. Thanks and 73 de Bruce

Sorry about your FT-102. The relays in the FT-102 have always been the main point of consternation with the '102. Yes, replacing the relays on the RF Unit usually fixes the problem. Make sure the relay under the bandswitch is replaced also. That one is a toughy to replace.
The Antenna relay can be a problem, but not as much as the other relays on the RF Unit.

Sorry about your FT101EE. Check/clean/replace two relays, the antenna relay
and the relay that is dead center in the top side of the radio.
Both will cause intermittents like that.

386sx-16 with math co processor installed on board.
4 meg of ram
3.5 floppy
85 meg hard drive
keyboard.
vga video on mother board
one serial and one parellel port on mother board

While you will not run windows 95 on these they do work really
great if you use a computer as a controler for another piece of
gear.

I have two of these, so if you bought both you could have computer
with 8 meg of ram and spares.

The price is $100.00 for each computer or $175.00 for both! (firm)

Also have a vga monitor 640x480 that will work with the computer. $50.00 (firm)

I will deliver in the dallas area, but shipping costs outside dallas are
extra.

I had a similar problem with my FT102 years ago. It would intermittently lose more than 20 dB of receiver sensitivity. In my case it was caused by oxidized contacts on the Norm/Separate Antenna slide switch on the back of the radio. I cleaned this switch with contact cleaner and the problem disappeared.

From: gbostick@luna
Message-ID: <536gk8$o4j@news.usf.edu>
Source record: 193073
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc

In many of the HF amps for amateur radio there is a cw/ssb switch that changes the plate voltage from low on cw to high on ssb. I have read that this is to maintain efficiency at the different power inputs used. The high plate voltage makes sense, in that for a given power level a lower current would be required. To run at a lower voltage, thus requiring a higher current at a given power does not make sense. So, if you can run 1000W input with 2500V @ 400MA, what is the reason for lowering the voltage to 1700V and then having to push 588MA ? What is the criteria for selecting the lower voltage value?

This is an equal opportunity question open to all that would like to share their answers, as I am a bit weak in the hi pwr linear amp design department.

214. Carrier around 146.76 in '96 Ford Explorer

Date: 1996-10-05 00:00:00 UTC
From: keith@stlnet.com
Message-ID: <536o2j$oh0@news.stlnet.com>
Source record: 193075

I have a constant 1Khz wide carrier that 'floats' around 146.76Mhz. +/- 5-6Khz. It seems to change frequency with the outside air temperature and driving conditions. I have a 1996 Ford Explorer XLT 4x4 with 4.0L engine. It causes me problems because the repeater I mainly hang out on is 146.775Mhz.

Has anyone else found this or had the same problems??

Thanks,

Keith KE�FV

215. AM on the IC T22A

Newsgroup: rec.radio.amateur.equipment
Date: 1996-10-05 00:00:00 UTC
From: Jonathan Kohn <leajen@paonline.com>
Message-ID: <325718E8.31C5@paonline.com>
Source record: 193076

The rig is supposed to receive AM on the aircraft bands. Does anyone know if it automatically switches to AM receive for those frequencies or is there a code to switch from FM to AM receive. I don't hear anything on AM and since I live near an airport I'm beginning to wonder if it does indeed receive on AM.

I intend to replace some of the filters in my NRD535, so if anyone has the replacement Crystal filters for the 535 at a good price, I may be interested. I also have a 1.8khz filter for the NRD that I would like to exchange for for the 300hz, 500hz or possibly the 1000hz, so if you have these, but are mainly interested in SSB, please contact by email

Also wanted, the Bandwidth Control Board for the NRD535.
I am in the UK.

Regards,

Joe Kirlew

Lucky us people of Holland (or if you prefer: The Netherlands), since our
powerlimit used to be 100 Watts, so no discussion neccesary.
Nowadays the limit has been raised to 400 Watts PEP.

I see you bought a FT-50R. I was wondering how the 800 MHz scanning works. Can you receive any cell phone calls (I know the band is blocked out but on scanners, sometimes you can get ghost signals). Also, do you know if it is possible to eliminate this block?

I'm thinking about buying a FT- 50R. How do like yours?

I sell the Motorola Radius line too, and I have noticed some receiver blow-by when I drive around town. I would take Chris's advice seriously. But they are fine for mobile use. May I suggest you program them for mobile use (the models you have probably go 438-470), and use them that way. The going rate for programming these is $25 per radio.

UHF repeaters are fairly inexpensive because the 5 mHz separation makes them a lot easier to handle than the 2-meter 0.6 separation. Duplexers, brand new, from Motorola, for 5-mHz UHF separation are in the $250 range. May I suggest you just buy a repeater or a mobile rig that will make a good repeater? GE Mastr II, GE MVP, or Motorola Micors seem to be modifiable to such use, and QST, CQ etc have ads from an outfit called Versatel Communications who will sell you the radios and instructions. See http://www.versatelcom.com A recent article in 73 or CQ featured one of these conversions. It looked doable, but it was not trivial. The trick was in preserving

the shielding between TX and RX after adding a second antenna connector, etc.

Maggiore Electronics Lab offers an inexpensive line of Repeaters, (see ads in ham magazines). We have one here at the local club, and it works o.k. Also, Ritron (a commercial radio manufacturer) has a small UHF repeater, about 4 inches tall, and 10 x 12 inches or so, that includes AC power supply, the capability of having a 12 volt battery in case of AC power failure, and, get this, built in duplexer. It works very well in my commercial applications. It does not have station I.D.....but see below.

Lastly, you can get individual receiver and transmitter strips boxed in individual die-cast aluminum boxes from a number of sources, like Maxon, Spectrum, Maggiore etc. These have, or should have, not only audio output but the squelch output. This is a voltage that swings from zero to some voltage when a signal is present (or not, both directions are common). You can get these little boxed strips for about $150 each (they are also type accepted for commercial use). Power is low, maybe 2 to 5 watts. You need power, controller and an external duplexer. A COR (carrier operated relay) is a simple thing to build, but a more complete controller with i.d., phone patch and such can be had in the Connect Systems, Inc model CS-800 duplex interconnect. I believe you can buy it retail at Amateur Electronic Supply. It is very, very good and I have set up several repeaters up with it in commercial service. It is a "repeater maker" with the addition of the aforementioned rx or tx strips.

Hope this helps. Ramon. AL7X, Nome, Alaska.

It seems to me like a strong crossmodulation from some (new?) nearby
strong station, since itï¿½s cured with the tuner it couldnï¿½t be the rig,
at least that is what I belive. Try to rotate the beam a se what
happends .
How does the AIP affect the AM ?? Are the staions fully readable in AM
mode ??

Well some small ideas....

235. FT-470 mod for headset VOX?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-10-05 00:00:00 UTC
From: sxn@eng.sun.com
Message-ID: <534ki6$gtl@engnews2.Eng.Sun.COM>
Source record: 193153

I just picked up a Yaesu YC-22 headset to use with my FT-470. I got it for PTT mode use, but this headset also supports VOX. Unfortunately the FT-470 PTT wiring won't handle the VOX keying (when I select VOX mode, the PTT is constantly open).

The guy I bought the YC-22 from at HRO mumbled something about a mod to the 470 that will allow it to support the VOX mode. Presumably by adding a resistor to the PTT path or such.

Has anyone done this mod? If so, I'd appreciate some hints to get me started.

Thanks,
--

Source record: 193157

Chris, free advice is worth what you pay for it. That said, here's my two cents worth. I started with the Bencher (nice paddles, but somewhat mushy feel - they are now on a pillow on the front seat of my truck and I use them mobile). Next paddles were the Jones Key available from Palomer Labs or Instruments or something like that - real solid construction and much better "road feel" than the Bencher - also easier to adjust. Next came the WBL Design paddles (about $95 US and without question the best I've got - they are made by a high speed operator (50+wpm) who couldn't find anything which was as responsive as he required - I would strongly commend these paddles to you - I can give you the tel # etc of the ham who makes this superb product.

I also have a Ne-Ke paddle which attaches to your leg for mobile use. Very unusual design, not as fast as some of the others, but very light weight for portable use.

Also have a Kitano Key which has two horizontal paddles. Haven't given it a fair test yet. It will probably work fine, is light weight for portable use, but I doubt if it will get a lot of use in my shack.

I like the WBL Design unit soooooooooo much that I'm considering buying another to use with a qrp station I'm thinking about setting up in my downtown office.

Hope this is of use.

Chris, free advice is worth what you pay for it. That said, here's my two cents worth. I started with the Bencher (nice paddles, but somewhat mushy feel - they are now on a pillow on the front seat of my truck and I use them mobile). Next paddles were the Jones Key available from Palomer Labs or Instruments or something like that - real solid construction and much better "road feel" than the Bencher - also easier to adjust. Next came the WBL Design paddles (about $95 US and without question the best I've got - they are made by a high speed operator (50+wpm) who couldn't find anything which was as responsive as he required - I would strongly commend these paddles to you - I can give you the tel # etc of the ham who makes this superb product.

I also have a Ne-Ke paddle which attaches to your leg for mobile use. Very unusual design, not as fast as some of the others, but very light weight for portable use.

Also have a Kitano Key which has two horizontal paddles. Haven't given it a fair test yet. It will probably work fine, is light weight for portable use, but I doubt if it will get a lot of use in my shack.

I like the WBL Design unit soooooooooo much that I'm considering buying another to use with a qrp station I'm thinking about setting up in my downtown office.

Hope this is of use.

243. [Q]: Improvement of Transmit Audio and Microphone Switch boxes... Suggestions?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-10-05 00:00:00 UTC
From: seeler@upei.ca
Message-ID: <325634d5.4445164@137.149.3.1>
Source record: 193161

Hi - I plan to make a microphone switch box that would enable me to switch between 2 mics (a Kenwood MC-60 with its original dynamic element; and a heil boom (with HC-4 Element) headset arrangement) and 3 rigs (kenwood TS690s, IC275 and an IC475).

My hope is to have a mike for DX / weak SSB signal use and a "good quality" / "broadcast" quality signal for rag-chewing......

I recognize that I will need a capacitor on the icom lines (0.47 - 1 uf) to prevent damage to the two mikes if I use the two mikes I have with the Icom rigs.

Since I am doing the switching with a data switch box I am also considering ways in which to improve the audio output - especially with the kenwood desk mike (MC-60). My voice - at least on HF is bassy using the MC-60 and needs some enhancement or bass reduction.... (sorry but physical type changes not to be considered :-))

My first question is this.....

Would the HC-5 Heil element improve audio output from the desk mike enough that I do not need to build an audio equalizer circuit - just change elements?

or....

Should I build an audio equalizer circuit even if the Heil HC-5 element is placed in the kenwood Desk mike to further "tweak" my audio output?

I have copies of the papers by heil (QST, July 1982: pg 11 - Equalize your microphone and be heard) and Doug Demaw (CQ, February 1994: pg 82 - Enhanced audio quality on transmit) and I am considering using Doug's circuit to "adjust" the audio from the two microphones.

Second.....

Is there a better mike, mike element or audio equalizer (cuircuit or otherwise) out there that I should consider? Would an electric mike element be a better choice over a Heil element (either HC-4 or -5)?

I welcome any suggestions or comments as to how to improve upon this area.

HAve a great week!

Source record: 193162

Hello
My Kenwood TS850 has developed a fault on receive.
When you listen on 20m with the tri-band beam there is a lot of AM
stations received.
If i use my AT230 tuner it cures the interference (manually tune ant).
The same thing with my 80m dipole.
The Ants are tuned for the bands.
I wonder if the filtering on receive has gone wrong as transmit is
ok with good SWR.
Could it be that the recieve side is out of tune not 50ohm or
something.
I want something to check before sending it away to be fixed.
Thanks

>I actually get on the air, that should change)

Standard makes good radio, and is very popular in Asia. Their prices
are higher in North America, and service is limited to one single
Standard service centre in the North East. This is why they are not
popular. I had to send my Standard all the way there to have a back
case replaced. A lot of my friends originally from Asia still own
Standard, especially their handhelds, and some have bought the newer
C508A. The C156A I have seen at a local dealer and it feels quite
solid so it is no cheaply made radio. It can be sold cheaper because
it doesn't include NiCd rechargable battery nor CTCSS decode board,
which are common on most handhelds sold in North America these days.
I just got a Yaesu FT-50R, and it makes me appreciate my Standard C550
(same as C558A in North America) more, because when my FT-50R is
getting "intermod" interference, my Standard is quite immune (or much
less.) Of course, you pay more for this brand too.

Older standard is quite hard to use, I hope this newer model w/
alphanumeric display will change that aspect.

Good luck.

246. Linear Amplifier Technical Question HELP!

Newsgroup: rec.radio.amateur.equipment
Date: 1996-10-05 00:00:00 UTC
From: axxis@infinet.com
Message-ID: <535on6$efm@news1.infinet.com>
Source record: 193164

I have a linear amplifier that utilizes a single 8950, which is fading fast. These tubes are rather expensive and hard to find. I've been told that I can use a 2057 because they both have a filament voltage of 13.5 volts. However, this tube is even more expensive and harder to find.

My question is this: I've been told that I can use a 6LF6 to replace the 8950. Would the only modification that would need to be done be dropping the filament voltage from 13.5 to 6 volts? Aslo, what output wattage can be reasonable expected from an 8950? 2057? 6LF6?

>

Motorola makes a RIC box. it's a repeater interface controller. Plugs into both of the mic jacks. Works fine, although there's no CW id or anything fancy, just simple repeater controller.

Use a good quality duplexer that is both pass and notch. The notch only type of duplexer will work in environments where there are no other transmitters.

Probably the most important, in the long run, is the article by George Daughters in the May 1996 issue of QST on replacing the 8875 tubes with a single 4CX800A. Most MLA-2500 amps are sitting around idle because of the high cost of 8875 tubes and this article details a very economical way to resurrect the amplifier.

run 1000 in on cw and in order to run 2kw "PEP" and keep the
plate impedance/efficiency the same, plate voltage was switched.
I don't think you would tune for the 588ma, but some lower number
that would give the same plate load impedance. I think most
tubes like the higher volts.which makes the amp easier to
drive with lower grid current, ssb or cw... Leave the switch
in ssb for all modes.

In the input circuit to the receiver there are a series of diodes which switch some bandpass filters in and out depending on which band is selected. The diodes are small and easily damaged. I had an amplifier arc back into the receiver and blew several of them and also the IC which controls them. A nearby lightning strike could do it too. They are replaceable (I changed mine) but the job is not for the faint of heart. If you have some experience repairing PCBs, give it a try. If you're at all doubtful, have a qualified technician do it. The operator's manual has a schematic and parts location diagram. Good luck.

Hi,

It changes the operating point of the tube, like class A, AB, B, C. In CW you typically run class C. It's a point on the characteristic curve of the tube that dictates how much plate current flows with a certain level of bias. (grid voltage) Go with the higher voltage, and tune the plate to keep within the legal limit. Most tubes drive easier with a higher plate voltage. Go to your local library or maybe some local old timer may have the Eimac 'Care and Feeding of Power Grid Tubes'. It does a great job of explaining the whole deal with load lines, impedances, and all. They're not too tough to understand. Only the Gate 2 Vanity Call operation is beyond comprehension. Cheers!

263. US Army R-392/URR, Collins type 7C, other antique radios

Newsgroup: rec.radio.amateur.equipment
Date: 1996-10-06 00:00:00 UTC
From: jbhertzb@unix.amherst.edu
Message-ID: <jbhertzb-0610960046040001@148.85.230.24>
Source record: 193031
Cross-posted to: rec.radio.amateur.equipment,rec.radio.swap

I recently inherited the following antique radio equipment from a college radio club that went defunct two decades ago:

*US Army Signal Corps Radio Receiver R-19 I/TRC-1
This unit was manufactured by Hallicrafters, in the 1940s or 50s as far as I can tell. The power will turn on and the speaker will buzz static, but I don't know how far it works beyond that. It looks in good condition. I have no idea how this unit is tuned; the case is marked "82 megacycles." It may be missing some tubes.

*US Army Radio Receiver R-392/URR
RX from 0 to 32 MHz in 1 kHz steps with tuning via digital number-wheels. The unit appears to be in working order and looks pretty good, though I haven't tested it extensively. 24 VDC power supply and full field manual & schematics dated 1954. The manual says "Collins Radio and Stewart Warner Electric." The case says "Dunbrow Electric."

*US Army Signal Corps Transmitter Tuning Units TU-5-B and TU-9-B.
I have no idea whether these units work or what transmitters they work with.

*US Army Radio Receiver RT-18/ARC-I
I don't know anything about this rig, or if it even works. It looks pretty beat-up.

*US Army carrying/operating case for Hallicrafters C118/TRC-1.
Beautifully made of wood and painted olive drab, with a drawer for operating accessories and a slide-out shelf. I don't have the radio.

*Collins Radio Type 7C HF power amplifier.
I believe that this unit was made in 1938 and is now very rare. It's missing some tubes.

*Wilcox Electric Type CW3 Communications Receiver.
It switches on and hums and gives static through the earphones, but I can't tell much beyond that. I don't know how it's tuned but I have a set of coils which I believe are swapped in and out of the back of the thing to give it a range of about 1 to 20 MHz. I also have the manual, a beautiful hardcover thing with full schematics, dated 1943.

*Hallicrafters Model SX-99 All-Band receiver
0.5 to 34 MHz via semicircular tuning dial. I think this unit is functional but may need some fixing-up.

I really don't know what to do with this stuff and no one in the club today is interested in using it. I would be interested in knowing whether anyone collects these old rigs, and what you think they are worth. If you

would like to swap for or buy any, and give them a good home, please email me at jbhertzb@unix.amherst.edu. I can provide further details if necessary, and may have some more parts or manuals lying around if I look hard enough.

Thanks

>> I own a Standard C558a dual band HT...extremely well-built...
>> personally I wouldn't hesitate to buy more Standard gear.

I second those emotions, Eugene. I also own a C558a, as well as a couple of C288a 220mHZ HTs. Wouldn't trade 'em for any of the competition's units.

Hey - I have had EXCELLENT results with Maha's Nickel Metal-Hydride MH-CNB-153 battery on my C558a. SAME SIZE as the 700ma CNB-153, but it packs 1200ma! It's about .4 ounce heavier - but it a great performer. And LESS MONEY than the original CNB-153, too.

This am I recived email from Ryan, K5WDT concerning a message I had sent out about a dying ht, but when I went to reply to him, it said that address was not open. The address that he used is ryan@nmt.edu

In any case Ryan, if you see this, yes..my ht is set up to work the repeaters completely. I used it when I first moved into the new place and then didn't touch it for two days. When I tried it again two days later, it wouldn't do anything except pick up the 146.67 machine over here. I have no idea what the problem is with it since it did work before and now doesn't. Like I said, I really can't afford to send it in to get it fixed and don't really know enough to try on my own, but I am willing to try. Any ideas as to what may be the problem adn how to fix it will be appreciated a lot.
Thanks & 73's

>
> KD4GEU@AOL.COM

Here it is:

ftp://oak.oakland.edu/pub/hamradio/mods/alinco/dx70.mod

Quote:

Ok, first an apology to all who sent msgs about these mods. Sorry for
the delay in getting these out here.

The Alinco DX-70 can be configured as follows:
Extended TX, open the RX up to 35Mhz and down to 30 Khz, Open the VHF
side from 45-60 Mhz RX/TX. All can be done quickly by , by removing or
changing a series of chip-resistors located in the detatchable front
face
panel. This mod is a little tricky to perform, since it uses surface
mount devices, so I TAKE NO RESPONSIBILITY IF YOU BREAK YOUR RIG.
Alinco, further, in their mod sheet, warns that performing this mod
incorrectly will NOT BE COVERED via warranty. At first, I tried using
a
Salami sized soldering iron--- take my word, get a good, very fine point
iron of about 15 or 20 watts max! Make sure it is static guarded too.

Ok...Here we go.

1. disconnect power
2. disconnect antenna
3. remove control head, disconnect control cable
4. remove 4 screws on back of control head,
5 remove (unsnap is more like it) the control head back panel.
6. THE MOD:

Once you have the back panel removed, and using the big VFO knob as
your guide (circuit board facing you, LCD display not facing you). The
VFO knob should be on the left side. On the right side, in the lower
right hand corner, you should see 2 distinct columns of chip resistors.
On the board, they are NOT labeled, but I will draw the diagram below
to help you. You cant miss these because there are 5 chip resistors in
the left-hand row, and the right-hand row has 7 chip resistors. Above
both rows is a solder-pad.

a(::) h(::)
g-
i-
b - j-
c - k-
d - l-
e - m-
f - n-

Several chip resistors will be soldered in, depending on the model
of your rig, and a solder pad is jumpered. Here are the mods per
Alinco:

a. 45-60 Mhz TX/RX - solder a 0ohm or jumper across location i
b HF RX down to 30 Khz - remove the jumper m
c. beyond just Mars Mod - TX/RX everywhere remove both jumpers c and e
d. HF RX up to 35 MHZ - solder a bridge across pad a

After performing the above mods, reassemble the unit.

7. DONT FORGET to reset the microprocessor (with the radio off, hold
the F button and simultaneously turn the power on.
All memories are wiped out, but the new bands are opened.

I've tried all mods with my Alinco rig and can confirm they work. I am
able to pick up business band communication in the 46 Mhz range (FM),
and
cordless phones in 46/49 range. It TX's everywhere now too.

I do not take responsibility if you perform this mod incorrectly, and I
am not responsible for your operation practice if you choose to
illegally
transmit out of band.

Thanks and again, sorry for such a delay in getting this out here.

From: k1bqt@aol.com
Message-ID: <5399ra$8sg@newsbf02.news.aol.com>
Source record: 193101

Hi Jim--

This may be a patisan reply because I do a lot of work for MFJ, but the general scope of my comment would apply--even if you had purchased the AEA version of the loop. I feel very confident that the loop will provide far better reuslts than you would obtain by almost any other means--short of putting up a full-sized dipole at 1/2-wave or more in height. The loop is extremely efficient for an antenna of its size. The price you pay for this efficiency is measured mostly in loss of bandwidth. But, since the loop is remotely tunable, about all you really lose is the ability to QSY instantaneously. Good luck with it--and with your treatment. If I were in the same situation, I would do exactly what you are doing.

>
>The guy I bought the YC-22 from at HRO mumbled something about a mod to the
>470 that will allow it to support the VOX mode. Presumably by adding a
>resistor to the PTT path or such.
>
>Has anyone done this mod? If so, I'd appreciate some hints to get me started.

Well, I don't know how the YC-22 does VOX PTT, but I do know how the
FT-470 does PTT. It uses the "leaky PTT" method common to Icom, Standard,
and Radio Shack HTs. To cause it to transmit, you place a 2.2 k resistor
between microphone high (the tip of the smaller plug) and ground (the
sleeve of either plug). A resistance higher than about 4 k won't key it,
and a resistance lower than 1.5 k will load down the audio. If the YC-22
works normally in PTT mode, then it is doing this because it's the only
way to key this radio.

If it is keeping the radio keyed all the time in VOX mode, there are a
couple of possibilities. First, VOX may be active, IE you may not have
VOX sensitivity adjusted properly. Second, and more likely, it may be
trying to rob power from the mic high line to run the VOX circuitry.
In fact if it doesn't have an internal battery, it *must* be trying to
rob power from the radio to run the VOX circuitry. This is loading the
line to an equivalent of less than 4 k above ground and keying the radio.

There may be a couple of possible cures for this. You could try
powering the VOX circuitry off an internal battery so that it doesn't
load the radio keying line for operating power. I have no idea how you'd
do this since I haven't seen the schematic of the YC-22. Or you might
try reducing the value of the resistor in the FT-470 which pulls the
mic line "high" in the unkeyed state. This would allow more current
draw from the radio before the voltage is pulled down enough to key
it, and might allow the VOX circuitry enough power to work properly.
This fix is likely to work, but I don't know what resistor value
you'd wind up having to use. It may be fairly critical. I'd try
tack soldering a 100k pot across the existing resistor and playing
with it until I got the keying right, then measure the pot and replace
it with a fixed resistor.

You really need to get the schematic for the YC-22 to be sure about
any of this. If one didn't come with it, bug Yaesu. They're usually

pretty good about furnishing schematics.

Hi name is Randy
I have for sale a Henry 2KD5 Classic HF amplifier.
It runs a pair of 3-500Z tubes full output. The amp is a 9 on a scale of 1 to 10. I'm asking $775.00 plus shipping. If interested call me at 937-372-2492

Thanks & 73's

Randy

298. Wanted: Test Equip

Newsgroup: rec.radio.amateur.equipment
Date: 1996-10-06 00:00:00 UTC
From: Richard Hager <rhager@millcomm.com>
Message-ID: <32587DE7.596E@millcomm.com>
Source record: 193111

Hello,

We are a manufacturer of CNC controls for machine
tools. We'll trade brand new controls or control
components with full warranty, for test equipment.

If you've been wanting to add CNC capability to your
shop, and have some unwanted test equip sitting
around, please let us know. This might be a good
deal for schools, universities, or large corp's with
surplus test equip on hand. Individuals welcome also.

Items WANTED:

-Tek current probes, A6202 w/AM503 amp. 2-6 pieces.

-7104 mainframe, especially w/7A19-7A29-7B10-7B15 plugins

-2467, A, B Tek scope w/probes.

-Modern Digital Scope. Open to suggestions

-In-circuit emulator for 486. must be complete & working.

-Spectrum Analyzer, standalone or 7000 type plugin
Like 491, 492, 7L5, 7L12, 7L14, etc..

-Also interested in low-freq FFT type for vibration and
control system analysis. Like HP, Stanford Research, etc.

-RF Generator, like HP8640, etc. 1 or 2 units covering
10khz to 1ghz.

-Function gen w/lin-log sweep, minimum top freq. of 11mhz.
-Pulse Gen, 50mhz min, 100mhz prefered. w/variable risetime.
-Sweep Gen, 1-500mhz

-Tek curve tracer, 576. Hi-pwr fixture a plus.
577/D1 is a possible alternative.

-Tek DCS01 capture camera.

-Good universal freq/period counters, like HP5315/16, 5345, etc.

-Tek TM500 plugins for scope cal setup:
Sweep gen plugin
Time mark gen plugin
Dual trace Scope plugin
500mhz counter plugin

Leveled sine wave gen.
FGxxx function gen for TM5xx, prefer FG504.

-Tek 7000 series equip:
7A12/7A26 2-ch plugins
7A42 4-ch plugins
7B53A timebases
7B92A timebases
7T11A and 7S11 sampling plugins
7B10/7B15 timebases
7000 series cal fixtures and equip
7000 series spectrum analysers, 7Lxx

-Regular Tek scope probes, 6105, 6106, etc..

-Other equip will be considered also, for example:
Fluke 8060A DMM's or equiv. And/or good bench DMM.
Temp measurement stuff, especially IR thermometers.
Grid Dip Meter, LCR meter/bridge, Q-meter, ???

-Also looking for some older stuff for personal
restoration project: 564B, 3T77A or any 3Tx

Please send email to address below, attention Richard.
Info on CNC controls is at the web site address below.

Thanks!

Richard

The mobile duplexers actually will handle 45 watts, which is a common power level for UHF duplex radios. More power is rare, and not reliable in mobile UHF or VHF rigs.

Isolation at 5 mHz is adequate; ie, you will hear anything with the mobile duplexer than you will with a fancy one, regardless of what the books and experts say. Try it. Turn the trasmitter off on a weak signal....still there with the TX on. A "mobile" duplexer with 4 cavities will perform right along a 4-cavity duplexer of larger size.

What will not work is close spacing between transmitter and receiver frequencies with the small lduplexer. Mobile duplexers on VHF, with 5 mHz spacing are fine, but with 2-meter 0.6 spacing, it will desense. At 440 mHz, 5 mHz is the minimum for separation. The once used 1.6 mHz or 2.5 or other odd splits I've seen do not work with the little ones.

I have a repeater operating here with the RC-1000 controller. Is it like the RC-100 ? The RC-1000 is about $200 or $300 as I recall; and it draws a lot of current. In the repeater in question, the receiver draws 70 ma, the RC-1000 takes 230 ma. This can really cripple you with solar power....as I found out!

Hear you on the legal requirement to control the repeater. This could be by radio on the repeater input, by radio on a control link, by telephone line, dedicated or dial up, or manually by a control operator. All have their drawbacks, even though all are legal. The usual drawback is that the repeater trustee, which has the secret on/off codes is out of reach when the idiot using obscene language comes on the scene!

From: dove@lothlorien.com
Message-ID: <dove-0610960806410001@chartreuse.lothlorien.com>
Source record: 193119

I'm preparing for the purchase of a dual-band HT, and I'm interested in hearing from folks using either the Yaesu radio, or the Kenwood TH-79A. I've read the specs pretty closely, and am interested in first-hand opinions about both products.

(I'm aware of the recent allegations regarding the possibility of Kenwood's selling radios in some inappropriate outlets; I've watched both sides of the dispute with interest, but would like to keep the discussion on technical/opinion issues related to the radio, not the marketing.)

Email to me is fine, and I can summarize the result if folks want.

Thanks in advance!

309. Info needed on Heathkit HX20 TX

Newsgroup: rec.radio.amateur.equipment
Date: 1996-10-07 00:00:00 UTC
From: cdorn@gpu.srv.ualberta.ca
Message-ID: <53bpv3$1266@pulp.ucs.ualberta.ca>
Source record: 192972

Hello again,
Picked up an old Heathkit HX20 transmitter last week from a local Ham, and could really use some info. The unit appears to be in good shape, but I do not have the manual for it. I will look around locally for a manual, but in case I come up empty, does anyone know where there might be a manual? Also, I could use some general info such as date of manufacture, output, general performance, and whether there was a companion RX that utilized any kind of transceive function. Basically, anything that you could share about the HX20 would be helpful. This unit also came with a solid state T/R QSK kit designed by Radiokit.
Thanks,
Chris VE6RDC

I have an Icom 2340H, which shares this characteristic with the 2350. I
don't particularly like it, but I'm not as upset as is Mr. Stewart.

Interestingly, my Icom IC2SRA HT, which has a 2 meter radio and a scanner
which can dual receive, automatically mutes the scanner receiver when you
transmit.

I like Icoms and have used them since I got an IC-22 in 1974, but I think
a selectable mute feature on the 2350 would be a good feature.

316. FT-736R diode matix for band coverage.

Newsgroup: rec.radio.amateur.equipment
Date: 1996-10-07 00:00:00 UTC
From: Jim <dont@spamme.net>
Message-ID: <32598C2B.167E@spamme.net>
Source record: 192979

Hi,

Has anyone been able to decipher the diode matrices for the band coverage in the 736R? I have seen a mod listed to expand the 2m range by adding D27, and this mod goes on to explain that similar mods can be done to the other bands. Unfortuantely the matrices for the other bands are not configured similarly to the 2m band and one can't simply add a diode to the corresponding position for the other bands.

It looks like there are two nibbles (4-bit) values labelled MAIN and SUB to be set for each band.

I'd like to mod the 6m module to be able to use video carriers as an indicator to DX. Two and 440 are to be moded for use with wideband transverters for microwave bands.

Thanks in advance,

Jim

From: k5rov@juno.COM
Message-ID: <19961007.092310.4647.0.k5rov@juno.com>
Source record: 192981

Rick, K1BQT

Thanks Rick for the info on the MFJ Loop. I should have it by next week. They must be selling well because they have quite a backlog. I really appreciate your comments concerning the antenna.

By the way, back some years ago, I build the little 15 meter QRP transceiver you wrote about in 73 Magazine. I made the usual mods, as HAMs do, including using a CB transistor in the final, and making my own layout, etc. But the basic circuit is the same, and it worked from the start. I sure had a lot of fun with it before the band went dead. The little rig is still sitting here, waiting for the band to re-open.

Again, thanks for the info, and best 73...

Jim, K5ROV

Am interested in obtaining details on making the FT-411E usable on Marine frequencies. Anything out there, it receives the maritime channels but does not Xmit that high.

Jim K4ZDZ

My first receiver was an Eico Space Ranger shortwave receiver that I built from a kit in 1967 when I was 12 years old. I still have it, but it was never a "communications grade" receiver.

When I got my Novice license the next year, my first rig was a desk crushing Hallicrafters SX-101 Mark III and a crystal controlled Heath DX-60A (as was required for Novices in those days).

322. Re: RCI-2950

Newsgroup: rec.radio.amateur.equipment
Date: 1996-10-07 00:00:00 UTC
From: Jim S <Saeger@gat.com>
Message-ID: <32595A42.1C12@gat.com>
Source record: 192985

Personally, I would go with the HR 2510. Both are made as so called "Ham" radios with the probable intent to be used on CB (both are easily modifiable to CB). But the HR 2510 has available an alternate PLL chip called "CHIPSWITCH" that adds all kinds of features including frequency storage and splits plus operation on the 12 meter band. Also, my opinion is that the Uniden is a step above the RCI in quality but they both suffer from some the common faults of inexpensive radios, e.g., wide selectivity... practically useless on CW if the band is busy and crowded, and a comprimised AM/SSB selectivity that is quite narrow for AM (CBer's willneed this) and quite wide for SSB.... Both have crappy mics that either need new elements (my opinion) or complete replacement (more costly with up/down switches) In spite of the above, $200 is not much, but then again who are you going to talk to... 10 and 12 meters are dead except for some sporadic E. and CB is sporadic without the E.. I have an HR 2510 and like it allot... I had the idea that I would find all kinds of local rag chewing on 10.. but after a few months of listening and calling I finally put it in storage for a few years until the band opens up.... JimS

P.S. sorry.. can't comment on the finals for the RCI.. I've heard that the 2510 uses MRF 477's but that was by rumor not inspection....

What is it:

It's a 2 meter FM tranceiver. It was only designed to cover a 2 Mhz portion of
the band but you can tune it select the 2 Mhz part you want. It only has standard
splits or simplex and should have 1 watt out in low and 25 watts out in high
power. It has no memory.

As far as I know it was only available as a kit through an NRI correspondence
course, I built one. Somewhere around here I still have the books. As far as I can recall there were several (4-9) books that dealt with the tranceiver.
They are all about 1/4 inch thick. I'll try to find them and get back to you.

I think I put mine together in the mid '70s, but I'm not sure how long before
or after it may have been part of one of their courses.

I still have mine and it works, sometimes. The biggest problem I've had is the
lousy (cheap) connectors they used to connect the circuit boards to the chassis.
If I clean the connectors and reseat the cards every 3-4 months it works fine.
I'm still looking for a good contact enhancer/lubricant to treat them with, I'd
like to stretch it out 12-18 months.

>
> Would Appreciate the help, willing to pay for copying cost and mailing if
> avail. please e-mail reply to:
> Dan Jaume KF4LOO
> wyseguy@flinet.com

We can fugure out something! The books I have (if I can find them) have schematics and even tutorials on how the thing is supposed to work.

Did you find one someplace? A hamfest? What did the previous owner say about
it?

With any luck this should come to you via mail and the news group, at least that's
what I'm trying to do. I wanted other Conar owners to know they were not alone.
But we can carry on future corespondence via email, unless (I can't imagine it)
more people are interested.

327. send no money

Newsgroup: rec.radio.amateur.equipment
Date: 1996-10-07 00:00:00 UTC
From: Jeff <jdlemast@mail.netusa1.net>
Message-ID: <3259CD88.1C40@mail.netusa1.net>
Source record: 192990

The procedure is simple:

1) Write your name and address on 5 sheets of paper.
Below that, write the words, "Please add me to your
mailing list." Fold a $1 bill in each piece of paper
and mail them to the following 5 addresses:

1. H. McAllister
9543 East 500 North
Kokomo, In 46901

2. Daniel Sutherland
20 Greenville Drv, Grovedale,
Geelong, VIC 3216

3. Thomas Andersson
Ringvagen 43
Stockholm
SWEDEN

4. Per Hellberg
Poste Restante
34220 Alvesta
SWEDEN

5. J. Shoffner
711 South 300 West
Kokomo, In
46902

2) Now remove the top name from the list, and move the other
four names up. In other words, #5 becomes #4 and so on.
Put your name as the fifth one on the list. Use a simple
text editor such as Notepad, in your "accessories" window
(If you have MS-Windows), or DOS editor. In fact, any
editor will do.

3) Post the article to at least 200 newsgroups. There are
17,000, so it shouldn't be hard to find 200. Try posting
to as many newsgroups as you can, and the bigger the
newsgroup is, the more people are to see your message!

You are now in the mail order investment business, and
should start seeing returns within a week or two. Of course,
the more newsgroups you post to, the greater your return is.
If you wish to remain anonymous, you may use a psuedonym,
call yourself "The Manager","The Boss", whatever, but make

sure your address is correct.

Now, here is why the system works:

- Of every 200 posts I made, I received 5 responses. Yes, only 5. You make $5 for every 200 posts with your name at #5.

- Each person who sent you $1 now also makes 200 additional postings with your name at #4, i.e. 1,000 postings. On average, therefore, 50 people will send you $1 with your name at #4. Average return with 50 people = $50.

- Your 50 new agents make 200 postings each with your name at #3 or 10,000 postings. Average return 500 people = $500.

- They make 200 postings each with your name at #2, which is 100,000 postings. Average return is 5,000 at $1 each = $5,000.

- Finally, 5,000 people make 200 postings with your name at #1 and you get a return of $50,000 before your name drops off the list, AND THAT IS IF EVERYONE DOWN THE LINE MAKES 200 POSTINGS! Total avg. income in one cycle = $55,555.

From time to time, when you see your name no longer on the list, you take the latest posting that appears in the newsgroups, and send out another $5, and put your name at #5, and start posting again. Remember, 200 postings is only a guideline. The more you post, the greater the return.

THE ONLY COST IS $5, AND 5 STAMPS, 5 ENVELOPES and 5 PIECES OF PAPER. Anyone can afford $5 for such an effortless investment which produces such SPECTACULAR RETURNS.

There are millions of internet users, and millions of new net surfers every month! This is the great advantage of the Internet. People all over the world can hear you and listen carefully if you talk reasonably. Many will take that chance! I agree. If it wasn't the Internet, and it was a small circle of people, the return would be rather small. It would not succeed.

But here on the Internet, it is a giant village, where thousands of new members join in every day! The amount of money returned to you is 200 times larger because the group is 200 time larger, i.e 200 postings, and the risk is zero. You CAN'T lose!

Remember, read the instructions carefully, and play fairly. That's the only way this will work. Get a printout so you can refer back to this article easily. Try to keep a list of everyone that sends you money and always keep an eye on the postings to make sure everyone is playing fairly. You know where your name should be.

REMEMBER - HONESTY IS THE BEST POLICY. YOU DO NOT NEED TO CHEAT WITH THIS IDEA TO MAKE MONEY! BESIDES, NOT PLAYING THE GAME FAIRLY IS ILLEGAL. SO LET'S BE REASONABLE AND PLAY FAIRLY, SO WE CAN ALL ENJOY THE INTERNET GOLD MINE.

GOOD LUCK TO ALL OF YOU, and remember, play fair and you'll be a winner. Come on and finally get those things you've wanted for a long time!!!

All cars and trucks have on board computers, microprocessors and a whole
bunch of other stuff that emits RF Energy.

If you are not using a outside antenna try that.
You could also try and shielding the suspect assembly with something like
foil?... make sure you shielding is grounded.

you might also check your hood and trunk lid to make sure they have
ground straps.

Good luck!

> Only dry cells are recommended.

Probably since you would only get 4.8 volts. I remember reading also
that
the proper nicad packs have current protection etc built in. I think
they mentioned that in the even that the battery case became short
citcuited
if it was fulled with nicads current would be in the order of 10 amps
& bust something. If you find it works with 4 nicads- use it. It wont
do any harm, just dont put the battery case in your pocket with your
keys.

>
> 2. May I use full power TX by using 13.8V from cigarret lighter etc

Why not!

> 3. If I charge with 13.8V, what shall be the time instead of 15h with standard charger?

I brought my FT50 (s) in the US and live in New Zealand where AC is 220V
so I use either my car battery, or a 13.8V regulated power supply.
When the FT50 reaches full charge, my observation is that the power
consumption drops down to a meer trickle- so I wouldn't be too concerned
about leaving it plugged in for any length of time, In fact, mine is
often
pluged into the 12V and left there.

342. Need Help To ID Regency 440 Radios

Newsgroup: rec.radio.amateur.equipment
Date: 1996-10-07 00:00:00 UTC

Source record: 193046

I recently go ahold of two Regency radios and need help in trying to identifying just what they are and if someone has a manual they will sell or copy for me.

The first is made by Regency Electronics, Inc. Satellite Beach Fla 32937. It appears to be a 450-470 mhz radio with two channels. The number 704-121, Rev. L, is on the circuit board and ST138 is on the chip. It is a mobile radio I would guess for commercial operation.

The second is made by Regency Land Mobile, Inc. Indianapolis, Ind. 46226. It is listed as a Model UC202, VHF handheld tranceiver. It has the name of "UTILI-COM" on the front and has an 11 volt nickel cad battery. It too is a two channel radio.

Anybody that has a clue what these really are and if I can convert them for use in the 70cm range I could really use some advice.

Many thanks...73s

>makes them a lot easier to handle than the 2-meter 0.6 separation.
>Duplexers, brand new, from Motorola, for 5-mHz UHF separation are
>in the $250 range. May I suggest you just buy a repeater or a

$250 buys a small "mobile" duplexer that will suffice for a 20 watt or
so repeater. A serious set of 450 duplexers that will do 100+ db of
isolation, which you need for the average 75-100w repeater with a
GaFET preamp (0.1uv or so for 12db SiNAD), you can expect to pay $550
or more (last time I bought TX/RX was 2 years back- I had enough
sticker shock to cover me until today).

>mobile rig that will make a good repeater? GE Mastr II, GE MVP, or
>Motorola Micors seem to be modifiable to such use, and QST, CQ etc
>have ads from an outfit called Versatel Communications who will
>sell you the radios and instructions. See http://www.versatelcom.com

Dittos- but add to the list the Motorola Mitrek - except for a horrid
audio squelch, these in many ways are easier and nicer radios than the
Micor vintage.

Cheapest basic controller that is "pre-built" is the Micro Computer
Concepts RC-100 - I think about $125. Not by any means the best
thing, but does basic timeout, ID, DTMF controls of transmitter, PL,
etc.

But the amateur with friends and/or time can bulid a basic ID box, and
a timeout timer. Although the regs require it (and it is something I
would never live without) - in practice a lot of people don't bother

placing any remote control functions into their repeater (like
remotely turning off the repeater).

Efficiency is part of the reason, but linearity is another part. In my
AL-1200, the plate idling current is 75 ma in the SSB mode, but only 25 ma in
CW. When driven to the same output, the CW mode is more efficient, but the
SSB mode is more linear. Personally, I leave it in the SSB mode all the time
because linearity is good for CW too... it reduces the tendency to generate
key clicks.

> andrew.cowan@zetnet.co.uk

The latest update on the 850 Saga.
I have used my friends 850 against my one.
So using an 80/160 crossed inverted Vee straight into both 850's.
My one on most bands that were tried AM stations received.
On the other 850 clear no QRM.
So my test with another 850 proves that it is not the system
that is inducing the AM signals
Could it be one of the LPF's?
I don't think it is a Band pass one as it seems to be on most
bands as these are different for each band.
Any ideas??

Hi Gary,

The reason for the high/low voltage was in the early days a PA could only run 1kW dc plate INPUT on key down carrier CW (about 500-700 watts out with normal PA's) , and 1 kW maximum indicated dc plate power input at modulation crests on SSB (at least 2 kW PEP plate INPUT power on SSB, and about 1200 watts or so PEP output).

If the high voltage was increased the correct amount for SSB the following would happen:

1.) The user could tune the PA on CW, and flip the switch to SSB without breaking the law by tuning at much higher power on carrier.

2.) The highest crest the PA meters would reach on SSB would be 1 kW on SSB and CW, both legal.

3.) The tube output impedance (and hence the tank control settings) would remain the same because the ratio of RF anode voltage to RMS anode current would remain the same.

This feature was slowly phased out of most amplifiers when the FCC changed the power rules.

By the way, this is why so many people "blow up" SB-220's. The SB-220 was designed to operate at 500-600 watts CW output, while dissipating about

400-500 watts in the tubes. The same with the L4B Drake.

It is also why most of the tuners sold today have exaggerated power ratings. They were rated to match the power amplifiers years ago, when a 2 kW PA would really only run 500 or 600 watts output. Most 2 kW antenna tuners really only handle 500-600 watts of CW carrier.

A trip to my home page reveals there are many good files and programs for amateur radio operators that want to use Mac computers.

<http://www.mv.com/ipusers/wd1v/>

* Ham Radio Test Simulators - where you can go from Novice to Extra Class practicing the actual tests right on your Mac! Check out the info on the new NO CODE license or scramble your neurons and learn Morse on the Mac too!

* Macnet Roster - a virtual "Who's Who" HyperCard stack with more than 750 entries giving the names, addresses, phone numbers, of radio operators all over the world that are using Macs. Check out their projects and their passions and put a design on your Mac Radio future when you see what neat things are being done!

* Mac Ham Radio Software Listing - as the name implies, its "The List" of the latest - much of it with FTP links so what you see is what you can get with just a click.

* Ham Radio.FAQ - compiled on a Mac with a lot of links to great Mac FTP sites for radio, electronic engineering, and similar data.

stan@mutadv.com

362. Drake TR-4C questions - please help me!

Newsgroup: rec.radio.amateur.equipment
Date: 1996-10-07 00:00:00 UTC
From: kc5ng@dlep1.itg.ti.com
Message-ID: <53b98m$cjd@sf18.dseg.ti.com>
Source record: 193066

I have some questions regarding the venerable Drake TR-4C:

1. There's a socket marked "34PNB" on the chassis, and it's shown on the schematic marked the same way. It has a jumpered plug inserted in it. Is this for an accessory noise blanker, like the 4-NB in the R-4C? If so, does anyone have a schematic and parts list for this item (so I can duplicate it), or perhaps have one of these that they would sell me? Is this unit the same as the 4-NB?

2. Is there any good way to add an i-f CW filter to a TR-4C? Could an R-4C CW filter be used, with a relays or PIN diodes to switch the filter in and out of the circuit in CW mode? Has anyone done this?

3. Are there any good performance enhancements for this rig, like building up solid-state tube replacements, better mixer diodes, improved S-meter action, audio hum reduction, etc? I haven't started searching the old ham magazines yet, but I intend to do so when I get some time.

4. Does someone have a COMPLETE, ORIGINAL manual I can borrow and copy? I have a weak copy with several pages missing, and the schematic is on two pages and is very weak and hard to read. I have access to a copier which can copy the 11" x 17" schematic in one piece with nice clarity.

5. The TR-4C manual mentions a "VHF modification kit". I assume this was to allow the transceiver to be used with the TV-6 and TV-2 transverters. Does anyone have the schematic and parts list for this modification?

6. How critical is it to have a matched triplet of 6JB6 PA tubes? What happens if you don't?

7. The manual says "260 W PEP input on CW". Does 160 W output seem right with the PA loaded to about 425 mA? Are the PA tubes getting soft?

8. The S-meter is terribly "scotch". Any way to improve this, or is this really a Drake characteristic like I've heard in the past?

9. I assume this rig requires a high-Z ceramic mic, is that correct?

Thanks in advance for any help you folks can provide me. 73!

Source record: 193069

Hello,
I recently borrowed a friend's Clipperton-L and was
struck by the contrast with the one I just bought. In particular
the friend's amp has a board with a set of toroid inductors and
trimmer capacitors mounted over the power supply rectifier area.
This board is wired to the bandswitch and appears to be a set
of switched filters. The toroids are quite small making me wonder
how they could be filtering the amplifier output. Are these in
fact bandpass filters? If my exciter has all spurs down at least
60db should I be concerned with trying to implement this filter
set? Are there other notable updates to the Clipperton-L design?

Curious,
Pete

366. Amplifier bandswitch needed

Newsgroup: rec.radio.amateur.equipment
Date: 1996-10-07 00:00:00 UTC
From: psoper@encore.com
Message-ID: <Dyx6KB.FpB@encore.com>
Source record: 193070

Hello,
I just got a used Clipperton-L and notice that
its bandswitch has been damaged by excess current. I'd
appreciate any pointers to possible sources for a replacement,
either standard or "creative".

Regards,
Pete

In article <32598C2B.167E@spamme.net> Jim, dont@spamme.net writes:
>Has anyone been able to decipher the diode matrices for the band
MODIFICATION OF THE PMS ON THE FT736R FOR THE 50 MHZ BAND
BY G0HEG AND G0TVL

Modification of the PMS on the FT736R for the 50 MHz Band
Extended coverage on receive from the front panel can be
achieved by means of a few simple but repetitive actions,
The receive can be extended from about 46 MHz to around 56 MHz,
By the use of the Repeater Shift. This give a coverage of about 10
MHz,
But it may be Greater or Smaller than this, There is no need to
snip
any of the components, and you will not need a soldering Iron for
this
Modification.
Note: Make sure that you Put the Highest Frequency in
to VFO B, and the Lowest one in to VFO A.

1/ Turn on your RIG.
2/ Put the RIG into Repeater Shift for the 50 MHz Band,
By Pressing the + RPT KEY.
3/ Set the OFFSET to 01.999.9.
4/ Tune the RIG to the Lowest Band edge,
of 50.000.0 MHz.
5/ Press the REV KEY (KEY 5).
6/ Press the UP MHz Button.
You should now see 49.000.0 MHz on your Digital Readout.
7/ Repeat Steps 5 & 6 Once More,
Alternating between both until you see 48.000.0 MHz
on your Digital Readout,
8/ Increase the OFFSET to 03.999.9.
9/ Repeat Steps 5 & 6 Twice,
This takes the Frequency to 46.000.0 MHz.
10/ Increase the OFFSET to 05.999.9.
11/ Repeat Steps 5 & 6 Twice,
This takes the Frequency to 44.000.0 MHz.
12/ Keep on Increasing the OFFSET by 2,
until you get the OFFSET to 51.999.9.
13/ at the same time as you Increase the OFFSET by 2,
Repeat Steps 5 & 6 Twice after every Increase in
the OFFSET,
until you get 00.000.0 MHz on your Digital Readout.

Be careful not to go beyond 00.000.0 MHz,
Because the RIG will Automatically Default back to
50 MHz and you will have to start again,
It is so frustrating when you lose so much of what you
have already done.
Now you should have been using VFO A as the starting point,
you should have 53.999.9 MHz in VFO B,
and 00.000.0 MHz in VFO A.
Press the Function KEY which is Marked with an (F),
Followed by the PMS KEY (KEY 5),
You have Just stored your New Band Edges in to the PMS.
Press the PMS KEY again,
this time slowly Tune across the Two Band Edges,
Until you see 999.999.9 MHz appear on your Digital Readout,
Now whilst still in the PMS,
Press the VFO B Button.
These Next Few Steps Are Very Important
1/ Press The following KEYS (KEY 9,KEY 2,KEY 4,KEY 9 in that
order).
The Magic Number is 9,2,4,9.
2/ Now Press the F KEY, followed by the PMS KEY.
3/ Press the PMS KEY again.
You have Just stored the New Band Edges in to the PMS,
you Should now have in VFO A,
Which should be 00.000.0 MHz,
and in VFO B,
you should also have 999.999.9 MHz
Press either of the UP of DOWN scan Buttons.
You will now find that your FT736R will now scan
up and down the Band from
00.000.0 MHz to 999.999.9 MHz,
or from 999.999.9 MHz to 00.000.0 MHz.
The End

I picked up one of these with the matching PS several years back as part of an estate. The PS had a bas regulator as I recall, I called NRI and they were still there, the service dep't. sent me the last two parts that they had on the rack, and I think these were one of a kind as I tried SEVERAL major suppliers who couldn't cross reference the part. It had a bad synthesizer whine which I could never lose, and ended up getting sold a few months later. Conar was the brand name for the in house products that NRI required you to use in the correspondence course. I still have some of the old course books somewhere, and they appeared to actually be a decent program for it's day.

Hey David,

I use LogPlus. It has way to many features to describe here. It will give you your any information
you would ever want on anything about your logs. Easy to use. You can download a demo off of
his web page. Just do a search for LogPlus. Email if you cannot find it. The price is right also.
This month it is on $38 plus $5 shipping. Also has conversion programs for all major logging
programs also.

I recommend this one highly. I ran LogWindows by AEA for several years and this one can run circles around it. Hope this helps you.

Hello.
I've just updated my FTV program, which does FAX & SSTV using a SoundCard, to decode Baudot using the same (FM) demodulation engine.

Here is a run down of the more interesting features:

(1) It keeps the demodulated signal in memory, so that the signal can be analysed again at a different keying rate or polarity! Garbage can be resampled on the fly, which means that minutes of received signals decoded at the wrong baud rate or keying polarity are recovered, on the fly, while still receiving.

(2) Keying rate and polarity are analysed automatically - standard baud rates are automatically set following analysis.

(3) Tuning oscilloscope available at all times, without loss of copy.

(4) Program works in real time.

(5) I wrote it, and I love it - I myself can't believe it works so well!

Download your copy of FTV from my web site, at:
http://www.geocities.com/SiliconValley/2504

System requirements, and the standard features of FTV are described in the following page:
http://www.geocities.com/SiliconValley/2504/ftv.htm

By the way, AM signals from low orbiting weather satellites are also decoded - no extra interfaces needed. Demodulation mode is user selectable in software.

Hope you all have a load of fun receiving 'words and pictures' - I hope to get some feedback !

All the best from Brian, 9H1JS, on the Island of Malta.

Help needed in getting PK2332 to work on Packet with a Mac IIsi and Macratt. The connect command does not seem to issue a send command to the TNC. All the hardware is fine. The rig (TM241) can be toggled on and off with the calibrate mode. Everything works fine on CW and RTTY. Does anyone know if there is a command that has to be set? Thanks for the help. 73

Source record: 192954

I have never experienced any problems with my HTX-202.
I also own a Kenwood TH-79a and TM733a. I prefer the Radio
Shack unit in terms of lack of interference due to intermod.
In my opinion, the audio quality on receive is better with
the Radio Shack. They are more cumbersome to use, but appear
more rugged. I use it for packet now, and it always works.
I also used it with auto-patch without problems. Throw away
the dummy load antenna that comes with it, it is too stiff,
and doesn't perform as well as one that you can find at HRO,
or out of the back of a magazine for around $17 from someone
else. Don't bother with the extra speaker-mic, they sound
lousy both ways.

402. Update: Windows Logging Freeware

Newsgroup: rec.radio.amateur.equipment
Date: 1996-10-08 00:00:00 UTC
From: m.mcamis@valley.net
Message-ID: <53eno6$vmf@dartvax.dartmouth.edu>
Source record: 192956

Disappointed with your commercial/shareware logging or
packet software for Windows? Try XMLog, freeware that's
available on the Internet. XMLog provides a flexible set
of coordinated logging and packet features.

* Version 1.25 is now available, this version has one
* change - it handles an install problem some people were
* having with incompatible versions of MSCOMM.VBX. If
* you got version 1.24 installed, you don't need 1.25.

Where to get XMLog on the Internet using a Web browser:

Try my new home page at http://franklin.ptgi.com

or...

Try the Boston Amateur Radio Club's home page at
http://www.acs.oakland.edu/barc/barc.html

- scroll down to the "BARC FTP Archives" section
- click on "FTP Archive"
- scroll down to "Software Archives"
- click on "PC Files"
- click on "logging"
- scroll down and click on "xmlog125.zip"

(Even though the directory says DOS, it really is a
Windows program...)

Getting XMLog on the Internet using FTP:

Sign on to ftp.barc.org with the userid of anonymous
and a password of guest. Move to the
/pub/hamradio/dos/logging directory and get xmlog125.zip

or...

Sign on to ftp.funet.fi with a userid of anonymous and
supply your e-mail address as the password. Move to the
/pub/ham/hf-log directory and get xmlog125.zip

Version 1.24/1.25 has many minor improvements - the big
changes are DXCC/WAS/WAZ award submission tracking and
support for the Radio Amateur Callbook (Flying Horse) CD.

If your PC only has 4mb of memory, Version 1.23 is still
available at my home page or at BARC's home page (version
1.25 requires 8mb).

The archives can be busy at times, don't give up if you
can't sign on right away. Let me know if you:
- want more info
- can't fetch the file
- want a diskette instead

Have fun...

For those keep asking, the following radios have been sold from the estate.

1. Kenwood TS690S
2. Micor UHF Community Repeater
3. DB Products DB4072 Duplexer
4. Icom IC38A 22 Radio
5. UHF MT1000.

Again these items have been SOLD.

Items remaining are:

1. Icom R7000 with cellular in excellant condition with box and manuals, $900.

2. Kantronics KamPlus with box and manuals in excellant condition with version 6.1 software. $150

3. Kenwood FT41R UHF Portable with battery and charger, AA battery holder and box and manuals $200

4. MT1000 6 Frequency Low band with two batteries and Rapid Charger (42-50 bandsplit, however there are some 6 meter freqs in it. $350

All items sold Cash Only, No COD, No trades.

Date: 1996-10-08 00:00:00 UTC
From: putra@it.uwp.edu
Message-ID: <53cnij$276@news.inc.net>
Source record: 193012

Hello to all from Ham Radio Explorer post 424.

Recently we got the crazy idea of getting together a 2m repeater for local operation. My buddy seems to think that getting a Motorola Micor (pre-tested and crystalled for $100, mind you) and then modifying it per QST's article on the subject is the way to go. Being that none of us has really had any experience in operating or setting up a machine, would someone please enlighten me to the pros and cons of the Motorola Micor setup?? How about the $80 repeater controller advertised in Nuts & Volts from a joint out in Pennsylvania??? How could we get away without buying a $350 pair of duplexers, and for that matter, how do those cavities serve to allow a repeater to do what it does??? know of any reccomended reading for a group of people like us???
Thanks for your input, hope to be hearing from you guys soon!

413. RACAL Comcal SSB Packsets

Newsgroup: rec.radio.amateur.equipment
Date: 1996-10-08 00:00:00 UTC
From: cranton@mail.island.net
Message-ID: <53cn0e$94j@cliff.island.net>
Source record: 193013

Does anyone have any info on RACAL COMCAL SSB Packsets. These are small portable, military (olive green), 40 channel crystal, 2-8 Mhz AM, USB radios. I have two of the units but no information about the pinouts for the two 6 pin audio plugs or the dc power requirements of these units. If anyone has any schematics or any other info they might be willing to share I'd be happy to pay copying costs or whatever. These are lovely little units which could possibly be put to good use with a little information. Please e-mail me at cranton@mail.island.net if you have any knowledge of these units. I talked with RACAL and received a very considerate reply but they had not retained any specifics on these units.

414. Alinco DJ-S41 opinions/mods?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-10-08 00:00:00 UTC
From: dave@hip-hop.hh.sbay.org
Message-ID: <53cmsg$ncc@moe.virtual.org>
Source record: 193014

The other day I picked up an Alinco DJ-S41T HT at HRO...
the size and price were attractive. (It's a palm-size
budget 440 HT with flip-up antenna, list $140).

I'm very happy with it so far - it seems to do as well on
340 mW of power as my other HTs with 2W or more.

Anyways, just wondering if anyone else has seen/used one
and if there are any undocumented options or mods. The frequency
coverage of 420-450 is nice and listening to the 450-480 band
would be a plus, if available.

I read that ArtSci has a modifications/alignment book version 9B
coming out in November, that is supposed to include a mod for the
DJ-S41.

Dave

Hi Pete,
In article <Dyx6z3.G7D@encore.com>, psoper@encore.com (Pete Soper) writes:

>of switched filters. The toroids are quite small making me wonder
>how they could be filtering the amplifier output. Are these in
>fact bandpass filters?

They are tuned input matcing circuits. The components on them were not the correct size in most Dentrons, and some didn't even have the board.

>If my exciter has all spurs down at least
>60db should I be concerned with trying to implement this filter
>set?

It probably is a good idea to have the tuned input, although in some cases you can get away without it. The primary function of the tuned input is to provide a path for harmonic energy generated in the cathode circuit of the tube. Remember the tubes conduct less than 360 degrees, and generate harmonic energy when in non-linear areas of cathode current.

The tuned input provides a path for these signals. It can greatly affect the IMD performance and efficiency of the amplifier even if the exciter is perfect.

> Are there other notable updates to the Clipperton-L design?

Yes. Remove the carbon resistors across the electrolytics and replace them with metal film resistors. Dentron miscalculated the dissipation and runs the carbon resistors too close to the rated dissipation, causing the resistors to age and fail.

The amplifier is unstable on ten meters, and needs a reduction in Q to stabilize it. I use a series R/C circuit in parallel with the suppression coils to stabilize tubes like 572's.

An Ameritron AL-80B bandswitch wafer will mount to your Dentron switch hardware and offer improved voltage breakdown. The probelm you had was voltage breakdown, not excessive current. The contacts are large enough, the air gap is too close at the ten meter end of the Dentron switch. Unless you are experienced in figuring out tank wiring, you might have trouble installing the Ameritron wafer because the contacts are rotated to new postions.

426. FT50 antenna alternatives

Newsgroup: rec.radio.amateur.equipment
Date: 1996-10-09 00:00:00 UTC
From: bnr@universe.digex.net
Message-ID: <53g6r9$10k@news4.digex.net>
Source record: 192876

A few weeks ago I posted a request asking for information on alternative antenna suggestions for the FT50. The stock rubber duck on the radio is about 7" tall (which is way too big for my taste). The FT50 uses an SMA antenna connection, which further complicates the search for a replacement.

I received a lot of suggestions and I ended up buying the ICOM FA-S270A from HRO for $25 (maybe less...). It is a replacement antenna for the ICOM T21A. The antenna is about 3 3/4" tall and has a very flexible tip. In my opinion, it is the perfect match for the FT50. You may wish to devise about a 1/4" gasket to place at the bottom of the antenna (I have yet to do this, but plan on it) - there is a small gap where the stock antenna has a boot at the bottom that extends over the connection and sits down inside the casing - the ICOM antenna stops at the connection and lacks the boot. I'm going to look for an o-ring or two, or maybe alter some gasket to fill this gap.

I have noticed very little change in this antenna from the stock one on either tx or rx on 2m or 70cm.

I would say that if the tall stock FT50 antenna bothers you when the radio is on your belt, like it bothered me...the ICOM FA-S270A is one of the better alternatives.

427. Q. Unusual RF component in 100 watt 2 to 30MHz wideband linear

Newsgroup: rec.radio.amateur.equipment
Date: 1996-10-09 00:00:00 UTC
From: hill@rowland.org
Message-ID: <53g96m$bft@shore.shore.net>
Source record: 192877
Cross-posted to: rec.radio.amateur.homebrew,rec.radio.amateur.equipment,sci.electronics.misc,sci.electronics.components

Can you identify an 4-terminal component called a ACR Z0-28F and looking something like a RF power transistor?

I just purchased two military 100 (200?) watt wideband linear "preamplifiers" (that's what they're labelled!) which seem to work fairly well. They work so well they burned out my 40 watt attenuator, forcing me to bring out my BIG loads! The amplifier uses a pair of MRF466 for the input and MRF429 for the output. These are "gull-winged" RF transistors with a bottom that reminds me of a TO-66 for transferring heat.

Anyway, for my application (flipping atom spins in a condensed-matter trap) I'd like to reduce the 3rd harmonic distortion of the amplifier. The amplifier has an external input for biasing the transistors toward class A operation. Each push-pull CE stage is base-biased with the above-mentioned unusual component, which has four terminals: the 1st one to ground, the 2nd to the two bases (bypassed with 22uF and via an rf isolating xfmr), the 3rd to a 200-ohm trimmer to the 4th terminal, which goes to the external connector for bias control.

With 0V to the external input, the amplifier draws no current. Applying +5 to +12 volts to the external biasing input changes the total current from to 1 to 4 amps, for example (while taking 0.5A on the control input). Although the unusual part is performing a "dc" function, it is manufactured as a high-performance RF part with 4 gull wings, just as the MRF466, and is bolted to the heat sink as well.

What is this unusual part and how does it work? Also, if I keep increasing the class A bias, at what point will I be in danger of thermal runaway and destruction? The amplifier's heat sinking is massive.

430. HW101 Microphone Hum - HELP!

Newsgroup: rec.radio.amateur.equipment
Date: 1996-10-09 00:00:00 UTC
From: TJB94002@UConnVM.UConn.Edu
Message-ID: <1781B9C3BS86.TJB94002@UConnVM.UConn.Edu>
Source record: 192880

After using my HW101 on CW with many good signal reports, I found I have 60 hz hum the first time I used SSB in PTT mode. I won't get to work on it for a while, so I thought I'd ask for input in the mean time. Here's the situation what I tried, and some questions;

Situation:
I ruled out power supply since no hum on receive. I don't have a stock crystal mike. I used a Radio-Shack 3 wire electret, battery powered with .05 ceramic blocking cap on output. Circuit is haywired on a small piece of wood. While trouble shooting, I listen for hum with headphones at speaker output and in VOX mode turn up Vox sensitivity so I can hear hum, but not trip Vox relay (anti-vox connection feeds some mike signal to audio amp). Since CW is OK, I am assuming its mike or mike amp related. Since I can hear it when not transmitting, I assume its not a balanced modulator problem. Mike is 18" from HWD101 power supply.

Tried:
Mike cable is shielded, 1 foot long and includes PTT switch. No hum when mike cable not plugged in or when plugged in with nothing connected on mike end. Hum appeared when I installed a 1.1k resistor in place of the mike and when I shorted mike wire to shield. Hummed when I shorted input to chassis with a 10" clip lead right at the mike input. Ohm meter shows all ground connections ok and PTT works. Voltage at power supply filter cap = 275V, plate = 60V, cathode = 3.15V. Connected a crystal headphone with 2 feet twisted pair wire and might have gotten some reduction in hum. Wiggled tube to make better contact - no change. Sheild is on tube. Connecting 1M scope across top and bottom of mic/cw pot reduced hum, but that also reduces mike amp output 33%.
Qu
Questions:
Do I need to completely cover electret mike circuit in sheild? I can test by shielding short circuit or resistor at mike. I will try a direct connection to tube on PCB to see if any ground related issues.

Thanks in advance for your help.

Well, you're getting a lot of input from those of us who have been hams for many years, as I have. That's probably not exactly what you're looking for, so I'll give you two answers:

In 1965, I was first licensed as a Novice, using a Hallicrafters SWL receiver and a crystal-controlled Viking Ranger that I bought used. My first "serious" equipment was the Drake R-4/T-4X twins, bought when I became a General in 1966.

The first radio I bought for VHF a couple of years ago was a Radio Shack HTX-202 HT for 2m. Since then, I've bought an Index Labs QRP+ (low-power HF transceiver) and an Icom IC-706.

Check out the Motorola Application Notes dealing with the 100 Watt
Amplifiers. They may use a similar device in their design. My guess
is that the device is bolted to the heat sink to track the thermal
characteristics of the amplifier. A 100 Watt BJT amplifier needs to
have its bias circuitry carefully designed to prevent thermal run-away.
As the amp heats up I would bet that your device reduces the bias
current. I am assuming that the MRF429s are BJTs.

By the way, where can other people get ahold of such amplifiers

Is it possible to setup a modem through the AT commands to transmit at high data rate in the absence of a receive carrier? I have succeeded at low data rate (300 bps) using analog loopback followed by digital loopback but cannot force a higher data rate.

Any ideas? Would appreciate e-mail and others may want posting. Thanks.

$550.00 is the asking price.

439. ***HW-101 melted finals***

Newsgroup: rec.radio.amateur.equipment
Date: 1996-10-09 00:00:00 UTC
From: tonyz@rose.hp.com
Message-ID: <53h41j$4fs@rosenews.rose.hp.com>
Source record: 192889

Hi, someone asked for an update once I found out
what was causing my final plates to glow red. I had
asked for help here and gotten may replies, thanks
Dean Hemphill and friends!

I had originally thought that the problem might be
due to some parasitic oscillation due to a neutralization
problem... the metering circuit ground had a cold solder
joint. It appeared to be working for rcv sig strength,
I replaced the meter, too with the same result. The
idle plate current was indicating 50 mA but upon
checking the cathode resistor, it was really 300 mA.

The finals heated up so fast, they finally had to
be thrown away before I could figure out what
was going on. Had another spare set of 6146's
and now it loads up fine.

I had bought the unit here on the internet.

"worked the last time I turned it on" --beware
this statement. That could have been 15 years ago! :-)

It certainly could not have been working when
shipped. The 2nd IF amp 6AU6 was bad, then I
had to figure out why I couldnt rcv USB and CW.

This turned out to be the product detector crystal.

All in all, a lot of grief, but I learned a lot
about the HW-101.

I had one when I was a teenager too and lost a
cathode resistor for the speech amplifier. That
was fun too.

At least when these old things break, you have
a good chance of fixing them yourself!!!!!

Cheers.

I haven't found the 800Mhz stuff yet but do have the Air band receive.
You must do the mod OR HAVE IT DONE BY SOMEONE WITH THE RIGHT TOOLS. I
stress that because the mod is easy with the right tools, 5 mins tops,
but easy to mess up without.

As for stuff not mentioned in the book.

Remote control function for TM-742, 733 and similar
turn radio off, hold down PTT and MR and turn on.
Kenwood has instructions at thier site.
Crossband repeat (at least I didn't see it in the book)
Function then monitor key.
Might be more but can't remember at this time. Be sure to check out the
Kenwood page for more info but it is in jpg format so hard to read alot
of it even if you dload it and print it (really really bad).

Hi All. I have an older MFJ 989-C with the old type solid roller inductor that is a piece of junk. A portion of it has melted with fairly moderate use with no more than 800 watts pep. Most of it is still useable and I am living with it for now. I was reading about their (MFJ) new air core roller inductor and was wondering what any of you thought of it. Does anyone know if the new type will fit into the older type of transmatch without any or little modification? Anyone know what MFJ charges to do this if it can be done or how much a new air core roller inductor would cost to do by myself. Thanks for any help.

There is a TS570 out now - actual rigs being shipped ahead advertising!
Seen one up close -played with the knobs, etc. at a hamfest Sunday, Oct. 6th.
Looks like a nice basic rig with limited DSP. I think it retails @ $1,300 US.
Not a replacement, but lower entry rig for the newbies per Kenwood rep.

Regards,

Patrick/WB9IQI

I believe the part that you are referring to was called a Byristor by CTC
(Communications Transistor Corp.) I think the CTC Part number was BY-1.
It is a diode with the construction of the
base emitter junction of a RF transistor, and a resistor from the anode to
the second terminal. It was intended to be used in
the base bias network of linear amplifiers to temperature compensate the
bias with the same characteristics a the RF transistors
base emitter junction. Motorola application notes use the base emitter
junction of a power transistor that is bolted to the heat sink to do the same job.
I remember the device being discussed in a article in Ham Radio magazine in the
70's and in an issue of RF design magazine in the 80's. I hope this helps. Regarding
converting the bias to class A It depends on the device, check the Motorola
application notes for info on this topic. RCA had a good application note on
the topic in there old RF power data book. The basic issue was hot spotting
which is improved by emitter ballast resistors in the RF transistor. I suspect though
that you will not get as much improvement as you hope going to full class A.
I suspect that increasing the negative feedback and other distortion canceling
techniques will give better results. I hope this helps

Ok, next question. From where did you get this number? Is there an
antique radio guide like the NADA blue book for cars? If this number
is true, I'd be interested in selling it. Do you know of anyone
interested in buying it?

I'm told from the previous owner that it works beautifully and it is
in good shape. All the buttons work and none of the knobs are broken.
I just haven't had the opportunity to even turn it on as I only got it
less than a week ago.

The Hi-Lo 25/7w pwr switch on this rig only works on FM... The rig is supossed to put out 25w SSB but my output with normal audio is only about 10w... This drives the TEN-Tec x-verter I have just fine... I did mod. the X-verter to allow direct PTT from the rig. (Standby jack on rear)... If your rig puts out more than 10w on SSB you can feed a DC voltage on to the Ext. ALC pin (1 of thpins on the Y-jack) to hold down then output... However don't leave the voltage there the whole time as I found out that the rig will put out more watts on with a voltage on that pin in FM mode.. That's probably why they have a FM ON pin on that same Y-jack... A little experimenting can figure out what your Votale level should be... I figureed out a little circut that apply the voltage to the Rig when the X-verter was on and not in FM mode...73's Pete n2mci@mhv.net

I can't help you regarding the value, but just a word of caution. Before you turn it on, make certain that you read and understand the tune-up procedures in the operating manual. As I recall, this rig has some very specific and esoteric procedures, including something like "never put the mode switch in X while the function selector is on 'X'" or something like that.

I have one in my junque boxe that doesn't work and needs repair. Good deal that you got one in good working order. I seem to recall that rig has more power than today's rice boxes, something around 200-300 watts.

Those are undoubtedly input filters. Reduced drive power and
improved IM distortion are the usual advantages.

I am still looking for help in forcing a simplex high speed connection with Hayes
AT compatible (or other) modems.

Rob Janssen wrote:

" In <325BD767.5131@toronto.cbc.ca> "T.A.Holden" <tholden@toronto.cbc.ca> writes:

'Is it possible to setup a modem through the AT commands to transmit at
high data rate in the absence of a receive carrier? I have succeeded at
low data rate (300 bps) using analog loopback followed by digital
loopback but cannot force a higher data rate.'

No. Highspeed modems talk to eachother at connection setup, and measure
the line characteristics to compensate for frequency and phase characteristics.
This is the warbling noise that you hear before CONNECT appears."

Good point. So a forced connect speed does not preclude this negotiation?

Is there not some test mode with which the modulator can be used at high speed
without detection of remote carrier and negotiation?

" So, you can only use a highspeed modem on radio (I suppose that is what
you are after) when the radio path is fullduplex so the modems can hear
eachother all the time. And even then it probably won't work too well,
because a radio path has distortions (due to multipath, changing propagation
etc) that a telephone modem is not designed to cope with."

Agreed. However, I am thinking of using a stable, high quality but unidirectional voice
(or wider) channel.

Keith,
Check with your electric fuel pump. There may be interference created
by the fuel pump. There is a bulletin from Ford on this situation and I
am not sure if this will clear your problem up, but there was some kind
of recall and a kit that would help correct similar situation. It may
be worth looking into.

Drop me a note as a reminder and I will look for the bulletin at work.

If the Hayes has "FAX" modes, try them. Like V.29 or something. I've
done
amateur radio links
using v.29 (which is the standard 9600bps mode) and it works fairly
well.
You'll need to use fairly long txd's.... something on the order of 400ms
due to the train sequence it sends, but other then that it works well.
You will need to make sure you audio is not clipping however as V.29
is 16 level QAM. The train sequence is (I think) about 250ms plus
another 150ms for the radio to stabilize. There is a fast train mode
you can use which is only 50ms long.

V.29 is a half duplex data modem standard. Center carrier is
1800hz. Some of the results I had got written up in QEX and
TAPR PSR a number of years back. Also, the Japanese have
done some work with this as well. They (I think) were using
the Rockwell chip set... I was using the Yamaha chip. I little
write-up is on the PRUG homepage (sorry, don't know the URL).
They (the Japanese) have also done some work with V.27 (7200bps)
which is a little more robust in a radio enviroment then V.29.

I've not tried the 14.4 fax modes.

On slowly "fading" channels, you shouldn't have much problem assuming
you re-train
frequently. Actually, its been my experince that a radio channel is

better in most
cases then a telephone channel. Now, I am talking about a properly
engineered link
with clearences in the fresnel zones. This of course is a VHF/UHF link,
not HF or
some "HT" style rubberduck packet station.

Good luck

481. Used Collins Prices

Newsgroup: rec.radio.amateur.equipment
Date: 1996-10-10 00:00:00 UTC
From: "RPVS, Inc." <gerickso@midstate.tds.net>
Message-ID: <325D5BA3.75CB@midstate.tds.net>
Source record: 192833

I'm looking for advice on fair and reasonable prices to offer for the following: 75S-1, 32S1, 516F-2, 312B-4 and SM-1. By Collins Collector Association guidelines, all pieces appear to grade out at "very good" with the exception of 516F-2 which has a large dent on bottom edge of case. All manuals and connecting cables are present. No boxes. Any info is appreciated.

Thanks,
Gary, WB0VYC

Well, I see a lot of riduculous prices for Collins gear on
the r.r.swap and most of the time there is no price at all.

I got a pristine package like the above, same models, except no SM-1
for $650.00

I think that is reasonable. I have only a small scratch in one
place on the front chassis edge ring on the 75S-1. Otherwise
immaculate.

Couple weeks ago, the same package (no SM-1) was going for about
$1200.00 which in my opinion is far too much to pay.

That dent is going to work against you though.

Good luck.

486. FS: Yaesu FT-40 Amateur HT.

Newsgroup: rec.radio.amateur.equipment
Date: 1996-10-10 00:00:00 UTC
From: eplatt@wco.com
Message-ID: <325d575a.194282@news.wco.com>

Yaesu FT40, 99 Channel radio. Includes tx/rx mod, tx and receives from 430 -484.This unit is LITERALLY the size of a pack of smokes, maybe a TINY bit deeper, but the same height and width. (Just add an antenna.) Does 99 channels Pl _AND_ DPL, Keypad programmable, dual VFO, digital voice (record up to 20 seconds from the radio or by mike and either play back through speaker OR back on the air! Record you call and never say it again! Searches PL & DPL (yep, don't know the PL? Just hit a key, and it tells you! (Can't find this in the manual, I think it;s a hidden trick.) Comes with low power battery pack, charger, manual, and box. Barely used. Would prefer Bay Area (California) but will ship. $275 BO. Must sell ASAP, make an offer, reply to eplatt@wco.com, or call 415-939-1037

487. FT-747 freq instability

Newsgroup: rec.radio.amateur.equipment
Date: 1996-10-10 00:00:00 UTC
From: Monty Wilson <mwilson@bangate.compaq.com>
Message-ID: <Dz2t1x.7Fx@twisto.eng.hou.compaq.com>
Source record: 192839

Would someone with a service manual for the FT-747 take
a look at the frequency-determining circuitry and point
me in a direction here? Let me describe the symptom:

Sometimes, either on receive or transmit, either SSB or
CW, the 747 jumps about 1 kc off frequency, and when it
is in this state the frequency "flutters" until it comes
back to normal, when it's rock solid again. Sometimes it
lasts only a fraction of a second, other times it goes
back and forth for a minute at a time.

I have seen it happen on at least two bands. The setting
of the VFO does not matter; in fact, I can have a memory
channel dialed up and it will exhibit the same problem.
When in receive mode the jump occurs, the pitch of the
received noise also becomes different. So it sounds like
the detection frequency of one of the detector or conversion
stages is varying relative to the crystal filter bandpass.

I would like to open it up and look for a bad solder joint
but some hints as to where on the board I should look would
be a big time saver.

Can someone help please? Write me at mwilson@flex.net

Hi - Heil recommends a 0.47 mf (microfarad) capacitor inline on the audio line (series) to block the 8V or so that is on that line from the rig.

> No. Highspeed modems talk to eachother at connection setup, and measure
> the line characteristics to compensate for frequency and phase characteristics.
> This is the warbling noise that you hear before CONNECT appears."

>Good point. So a forced connect speed does not preclude this negotiation?

No, it doesn't. Speed negotiation is only a very small part of this
process. The remainder is referred to as "training" and needs to be done.

>Is there not some test mode with which the modulator can be used at high speed
>without detection of remote carrier and negotiation?

Training is always required in these multi-phase multi-level modulation
schemes. Even FAX modes, which are largely unidirectional, use training.
A slow (300 bps) fullduplex negotiation phase is used to coordinate the
training, the remainder of the transfer is unidirectional.

>Agreed. However, I am thinking of using a stable, high quality but unidirectional voice
>(or wider) channel.

To use standard telephone modems you will need a backward channel.
When you design everything from scratch (or: at least the operating firmware)
you might be able to come up with some protocol that does the training
with only a single direction.

Rob

494. Motorola Radius Question

Newsgroup: rec.radio.amateur.equipment
Date: 1996-10-10 00:00:00 UTC
From: Greg Kaiser <gkaiser@starnetinc.com>
Message-ID: <325D8F63.4481@starnetinc.com>
Source record: 192846

I have a Motorola Radius in my car at work..and I am curious as to how to use some oft more advanced features (such as priority scan). I have 3 buttons (Scan, Select, and Monitor). I know how to setup the scan for normal scan (hold down scan, and then select the channels I want...then hit scan). But, how do I setup a channel as 'priority' for scan..this radio has a priority light, so I believe it has priority ability.

When I hit the Select button while its not scanning..i get SC, CH, etc options...what are these?

If basically someone could walk me through how to setup 'priority scan' and what these sc, ch, etc options are..let me know..

Email me at gkaiser@starnetinc.com

Thanks!

From: wrt@eskimo.com
Message-ID: <325d84b1.1489227@eskinews.eskimo.com>
Source record: 192847

My first receiver was a war surplus BC-454 Command Set which I used as a tuneable IF for a homebrew crystal-controlled converter on six meters. My first transmitter was homebrewed on the chassis of an old TV set I had stripped the parts out of and re-used. It was truly ugly, but it worked. I made a number of contacts with it and then figured out how to improve the design. My second one was homebrewed into a "real" cabinet and looked and worked pretty well. I used it for several years and had probably more fun with it than with the multi-$$$ rigs that came later. Those were the days...

The MRF466 is an NPN BJT rated for 40W (PEP) up to 30MHz. The
MRF429 is an NPN BJT rated for 150W (PEP) up to 30MHz. These are
both 28V devices.

>the control input). Although the unusual part is performing a "dc"
>function, it is manufactured as a high-performance RF part with 4 gull
>wings, just as the MRF466, and is bolted to the heat sink as well.

The unusual part may be a combination DC bias network (a diode
intended to match the characteristics of the RF B-E junction) and
RF feedback network for gain stabilization. Or something.

Dana, I may be wrong here, but I believe that varying amplitude -does- in
fact cause additional timing jitter (read: phase noise). The limiter is
a linear device.

If the edge rates going in are very high, then the added jitter will be
minimal. However, those high edge rates cause their own problems....
Have fun with it!

I finally decided to read one of these articles in an internet
newsgroup describing how to make $50,000.00 in only one month from
a $5.00 investment.

Of course I thought this was rediculous ,or some type of pyramid.
I talked it over with my family, an attorney, and my friends, and
they all agreed it was some sort of scam.I hate scams because
usually someone gets burned, and I didn't want it to be me!
I blew it off for a few weeks then saw another one in a
newsgroup I go to alot and thought, "Maybe this is legitimate!".
Besides, whats $5.00 , I spend more than that in the morning on
my way to work on coffee and cigs for the day.

Well, two weeks later,I began recieving money in the mail!
I couldn't believe it! Not just a little , I mean big bucks!
At first only a few hundred dollars, then a week later, a
couple of thousand , then BOOM . By the end of the fourth
week , I had recieved nearly $47,000.00. It came from all
over the world.And every bit of it perfectly legal and on the
up and up. I've been able to pay off all my bills and still had
enough left over for a nice vacation for me and my family.

Not only does it work for me, it works for other folks as well.
Markus Valppu says he made $57,883 in four weeks. Dave Manning
claims he made $53,664 in the same amount of time. Dan Shepstone
says it was only $17,000 for him. Do I know these folks? No,
but when I read how they say they did it, it made sense to me.
Enough sense that I'm taking a similar chance with $5 of my own money.
Not a big chance, I admit--but one with incredible potential, because
$5 is all anyone ever invests in this system. Period. That's all
Markus, Dave, or Dan invested, yet their $5 netted them tens of
thousands
of dollars each, in a safe, legal, completely legitimate way.
Here's how it works in 3 easy steps:

STEP 1.

Invest your $5 by writing your name and address on five seperate□
pieces of paper along with the words:
"PLEASE ADD ME TO YOUR MAILING LIST."
(In this way, you're not just sending a dollar to someone; you're
paying for a legitimate service.) Fold a $1 bill, money order, or bank
note inside each paper, and mail them to the following five addresses:

1- Philippe
2104 De Mexico

Chomedey, Laval
Quebec, Canada
H7M 3C6

2-. Herta Dunbar
1200 Oldfield Point Road
Elkton, Md. 21921

3- John Kelley
P.O. BOX 4363
Brockton, MA, 02403-4363

4- Colleen Walker
250 Cassadnra Blvd #428
Toronto, Ontario
M3A 1V1
Canada

5- Simon Dominguez
Flat 3, 27 Market Place
Burslem
Stoke on Trent
Staffordshire
UK
ST6 3AG

STEP 2.

Now remove the top name from the list, and move the
other names up.This way, #5 becomes #4 and so on.
Put your name in as the fifth one on the list.

STEP 3.

Post the article to at least 200 newsgroups. There are at
least 17000 newsgroups at any given moment in time.
Try posting to as many newsgroups as you can.Remember
the more groups you post to, the more people will see your
article and send you cash!

STEP 4.

You are now in business for yourself, and should start seeing
returns within 7 to 14 days! Remember, the internet is new
and huge. There is no way you can lose.

Now here is how and why this system works:

Out of every block of 200 posts I made, I got back 5 responses.
Yes, thats right,only 5. You make $5.00 in cash, not checks or
money orders, but real cash with your name at #5.

Each additional person who sent you $1.00 now also makes 200
additional postings with your name at #4, 1000 postings.On

average then, 50 people will send you $1.00 with your name at #4,....$50.00 in your pocket!

Now these 50 new people will make 200 postings each with your name at #3 or 10,000 postings. Average return, 500 people= $500. They make 200 postings each with your name at #2= 100,000 postings=5000 returns at $1.00 each=$5,000.00 in cash!

Finally, 5,000 people make 200 postings each with your name at #1 and you get a return of $50,000 before your name drops off the list.And that's only if everyone down the line makes only 200 postings each! Your total income for this one cycle is $55,000.

From time to time when you see your name is no longer on the list, you take the latest posting you can find and start all over again.

The end result depends on you. You must follow through and repost this article everywhere you can think of. The more postings you make, the more cash ends up in

your mailbox. It's too easy and too cheap to pass up!!!

So thats it. Pretty simple sounding stuff, huh? But believe me, it works. There are millions of people surfing the net every day, all day, all over the world. And 100,000 new people get on the net every day. You know that, you've seen the stories in the paper. So, my friend, read and follow the simple instructions and play fair. Thats the key, and thats all there is to it.Print this out right now so you can refer back to this article easily.Try to keep an eye on all the postings you made to make sure everyone is playing fairly. You know where your name should be.

If you're really not sure or still think this can't be for real, then don't do it. But please print this article and pass it along to someone you know who really needs the money, and see what happens.

REMEMBER....HONESTY IS THE BEST POLICY.YOU DON'T NEED TO CHEAT THE BASIC IDEA TO MAKE THE MONEY! GOOD LUCK TO ALL,AND PLEASE PLAY FAIR AND YOU WILL WIN AND MAKE SOME REAL INSTANT FREE CASH!

*** By the way, if you try to deceive people by posting the messages with your name in the list and not sending the money to the people already included, you will not get much. I know someone who did this and only got about $150 (and that's after two months). Then he sent the 5 bills, people added him to their lists, and in 4-5 weeks he had over $10,000!

TRY IT AND YOU'LL BE HAPPY!!! :o) !!!!!!!!!!

508. Kenwood 261

509. Oct 12 Radio Auction San Mateo CA

Newsgroup: rec.radio.amateur.equipment
Date: 1996-10-10 00:00:00 UTC
From: Koert Koelman <kkoelman@ix.netcom.com>
Message-ID: <325DE1E9.76DA@ix.netcom.com>
Source record: 192861

On October 12, 1996, the Palo Alto Amateur Radio Association (PAARA) will hold its 45st annual auction and flea market at the San Mateo Shriners Center, 1925 Elkhorn Court, San Mateo, CA. Doors open at 7:30 A.M. and the auction will start around 9:30 A.M.

Ham radio gear, electronic parts and test equipment is likley to change hands at bargain prices. Raffle prizes will be offered and coffee & donuts will be served. All in all it will be a lot of fun for those of you who have the post Foothill Flea Market blues.

Flea market table space is available at $10 per table. Auction charges are 10% of the sales price (buy-back subject to $5/max. charge per lot). Equipment donations are welcomed by the club. Proceeds benefit PAARA.

Directions to the Shriners' Center. From HWY 101 or 280, take the HWY 92 to the El Camino Real South exit. On the El Camino Real travel to 20th Avenue, where you'll turn right. One block and you'll see Elkhorn Court. Talk-in frequency is 147.45 simplex.

Please, note the location this year ... it is in San Mateo. See you there.

Koert KC6WCI

>Kory
>AC6RN
Hi Kory,
Rohn also makes a line of push-up masts, more rugged, heavier
galvanizing, higher price. Look much more rugged than radshack, but
sounds like your plans are a bit optimistic. 18 feet freestanding
above the eaves will not take much wind load. Would do better with a
HD flagpole or junk streetlight pole.
Good luck, Greg K3EWZ

I've had a FT-50R for about a month. I'm very impressed and pleased
with my choice. The reciever is very sensitive and I have found the
ADMS software to be very handy. The size is ideal, the only thing I
have found that I don't like is the SMA/SMC (whatever that threaded
coax connnector is called) antenna connection. The antenna is out of
scale with the radio, BUT it works great.

I'm still looking for an operator's manual for a TR-7500 2m mobile rig. I know it's not state-of-the-art, but it appears to work, and it was cheap enough, and I'm happy with it. I just want to figure out what some of these undocumented switches and plugs are on the back.

Also: I did locate and purchase a service manual for this rig. If you have one, and you want to know how to enable the six "extra" channels on any six of the frequencies not already covered between 146.00 and 147.97, let me know and I'll be happy to copy the relevant sections for you and fax, email attach a jpg or pcx, or snailmail a copy of them to you.

>loopback but cannot force a higher data rate.

No. Highspeed modems talk to eachother at connection setup, and measure
the line characteristics to compensate for frequency and phase characteristics.
This is the warbling noise that you hear before CONNECT appears.

So, you can only use a highspeed modem on radio (I suppose that is what
you are after) when the radio path is fullduplex so the modems can hear
eachother all the time. And even then it probably won't work too well,
because a radio path has distortions (due to multipath, changing propagation
etc) that a telephone modem is not designed to cope with.

I'm looking for info on a 4:1 balun for matching a ladder line fed dipole
to a coax output ant tuner.
I have a wide variety of ferrite and iron powder toroids with various
permiabilities. I'm wondering if
anyone knows why the Radioworks baluns are touted as "current" baluns?

The Carrier oscillator adjustments on the back of the 747 are probably flakey.

>Were any made by other manufacturers? Who? When?
>Radiomatt@aol.com

The SX-73 was made by Hallicrafters around the time of the Korean War.
QST carried ads for it in 1952-53. There is also an ad for the SX-73
in the ARRL Handbook, 1953 edition. As far as I know, the SX-73 was
a Hallicrafters model number, made only by Hallicrafters.

The military designation R-274/FRR (not URR) applied to both the
Hallicrafters SX-73 and the Hammarlund SP-600 series. Both receivers
cover 540 KC to 54 MC and have similar features, although they look
completely different. The SX-73 also has built-in crystal control of
several fixed-frequency channels, selected from the front panel.

I currently own an SX-73 and it is a fine receiver with very smooth
gear reduction tuning, excellent audio quality and stability. It's
been 20 years since I had an SP-600, but feel the Hammarlund looks nicer,
while the Hallicrafters works better.

> Steve --- N9ROU

I think you will have a problem with case interference, but it can be
solved by drilling new holes in the chassis and the front panel. The
roller is much better than the Delron core Oren Elliot part they were
using, the Q is about double.

Another alternative is a Cardwell roller. It isn't as good as the air core
because it has some series resonance problems but the ceramic form won't
melt.

By the way, be sure to use as much C as possible when matching the load,
to keep the Q down. That helps reduce heating.

Woops, usually these circuits are installed to lower the SWR for the exciter. Other than that, the primary advantage they provide a path near the tube for harmonics generated in the cathode circuit.That's the reason tuned input circuits affect IMD and efficiency. The tuned input needs to be within 1/32 of a wavelength of the tube at the highest operating frequency, that's about one foot on ten meters, unless special precautions are taken, and MUST be a low pass circuit that has a shunt capaciatnce at the tube end.

>
>Any ideas? Would appreciate e-mail and others may want posting. Thanks.

Telephone modems faster than 2400 baud go through a training and
negotiation phase at connection startup. This can't be bypassed by
an AT command. However you can use what is called a "short haul"
modem. These are designed to operate over leased lines and expect
a consistent EQ, hence they don't train and negotiate. Immac carries
several brands of these short haul modems. 9600 baud units are common,
and fairly cheap, faster units are available. They expect a 4-wire
interface, thus they should work on a good voice grade radio circuit.
(They can't deal with multipath, however.)

It *is* possible to force a Group 3 FAX modem to work on the radio
channel. There is a test mode for some of these which allows them to
go on-line without training. This can give you 9600 baud data. Some
amateurs in Japan experimented with this for a while. It's not an
AT command, however, you have to actually strap pins on the modem
chip to put it in test mode.

For robust operation on a radio circuit, you really need a radio
modem. And for speeds over 2400 baud, you really need a data radio
and not a voice radio kludge. Not only does this work better, it's
usually cheaper too.

From: webteck@usa.net
Message-ID: <325E644D.41E5@usa.net>
Source record: 192733

Last week (10/1 - 10/4) I put a plea for help for info on Cubic Electronics in Ocean Side, Ca. Some very nice gentleman gave me the info I needed. I have since had a complete system crash and lost ALL my messages...in fact I lost 2 hard drives with everything on them. The only thing I remember about the message was that his address started with something like "HONT"..his name was Loenk (?), The important thing was, he gave me the name of a guy that had worked for Cubic. He said the guy still repaired Cubic radios for a fair price. H ealso said the guy had a fax on during the day but in the evening it was off line. He gave me the telephone number and all the info I needed. I can't remember which newsgroup it was in. If he will PLEASE contact me again I would appreciate it very much. I need the same info again.

I am posting this to all the ham and radio newsgroups to find this good samaritan again. I sent him a thank you message, but of course that is also gone now so I can't get the address from there.

>

It sounds like the "unusual device" is a bias stabilization and tracking
device ... CTC used to make one called a BYISTOR ... it's coupled
tightly to the heatsink so it tracks the junctions of the RF devices to
help prevent thermal runaway. The 200 Ohm trimmer is clearly the means
of adjusting the "idle bias" of the class AB stages for the desired
quiescent current and linearity.

561. HT600 2-Channel to 6-Channel Conversion? I

Newsgroup: rec.radio.amateur.equipment
Date: 1996-10-11 00:00:00 UTC
From: st92kws6@dunx1.ocs.drexel.edu
Message-ID: <53mb70$64i@noc2.drexel.edu>
Source record: 192754

Is it possible to change the programming of the controller of an HT600 fro
being a 2 channel radio to being a 6 channel radio? I know that physically,
there is no difference, only the mechanical stop of the channel selector, which is easily
repositioned. All HT600's have the same part number controller flex,
so the difference must be a software issue.

I seem to remember seeing some kind of editor for physically looking at thecode inside the
radio (Not the regular programming software), but it's been a
while. I have a feeling that the solution is a simple one. I have searched the
service manual for somthing simple, like a jumper, and the closest thing I can
find is a jumper JU401, which looks like it has to do with the 2^4 pin of the
BCD channel selector. I still believe the answer is software.

In the regular programming software, all six channels can apparently be programmed, but
when the radio is actually used, positions 3 and 5 behave like 1,
and 4 and 6 behave like 2. The funny thing is, when I use the per channel
alignment part of the software, and it asks that you have the channel selector
in the right position, and it verifies the position, and displays it at the
bottom of the screen, the radio is reporting to the programming software that itis indeed
in channel positions 3,4,5, and 6 , not just 1 and 2!!!

If anyone can give me a hint here, it would be appreciated. Thanks,

Lou N2MIY
st92kws6@dunx1.ocs.drexel.edu

562. Re: Info on "4:1 current balun"?

Newsgroup: rec.radio.amateur.equipment

From: n4lq@iglou.com
Message-ID: <Dz4qJ5.Fus@iglou.com>
Source record: 192755

I can tell you one thing I've learned Rick. Don't use a current balun where you are dealing with a high voltage loop. Current baluns work great for things like loop antennas where voltages seldom get very high. Using one to match an 80 meter dipole on 40 meters may result in breakdown, unbalanced currents etc. I use a loop and a 4:1 current balun which is made of two 95 ohm coax cables about 1ft long and 100 ferrite beads and it works geat.

>What is it?!? It appears to be missing a tube, but we have no
>schematics...
>
>Any help appreciated...
>
>Thanks es 73,
>N2YRJ

Bob:

Wow, my very first transmitter...It was a little kit crystal controlled transmitter that was rated for (if I recall) 15 watts input. Two tubes: rectifier for the power supply and keyed oscillator. It may appear to be missing a tube because it used a tube socket (octal socket?) for the crystal. I made _hundreds_ of contacts with that thing...my father and I built that in 1970, I'm pretty certain.

I think the coil could be wound for either 40 or 80 meters, I don't think it would work on higher bands but I may be wrong.

Best of luck with it! It takes the old style crystal cases, I may even have a few around if they're of use to you.

568. FS:DC Power Plug:Kenwood,Icom,.....

Newsgroup: rec.radio.amateur.equipment
Date: 1996-10-11 00:00:00 UTC
From: n2cjj@ibm.net
Message-ID: <53k38q$pdu@news-s01.ny.us.ibm.net>
Source record: 192865

I have found a source for those DC power cord plugs. The ones I've got have 6 pins, male plastic with metal female (barbed) inserts.

The plug fits most 12VDC HF radios:
Icom 720, 735, 706..and alike, newer Yaesu and Alinco DX70.
Kenwood-TS120, 130, 140..430, 440, 450..850,..TS50,60, 660, 670...and alike.

Make your own power cord yourself, YOUR WAY!
Crimp or solder, long or short, heavy gauge wire, purple with polka-dots...

I'm offering the 6 position plug with 6 inserts for $4 each, or the deal 3 for $10. All prices include postage in the US.

To order, kindly send a check to:

R. Langston
286 Hudson Street
Cornwall-on-Hudson, N.Y. 12520

You can also email me for info at: n2cjj@ibm.net

It's a great deal if you use one rig at home, in the car and at work and are stuck dragging one power cord all over....

I still can't believe AES, HRO and others get $30 for a power cord.

*** Please reply through Email as well - thanks ***

Yesterday I bought a Sommerkamp FRG-7 at an auction. The Sommerkamp FRG-7 is AFAIK identical to the Yaesu FRG-7, and a colleague of mine told me that if you peel off the Sommerkamp label, there's a Yaesu label right underneath, so that should be no problem. :-)

My new FRG-7 looked fine, but when I tried it at home I discovered that the PLL won't lock. As far as I know, the FRG-7 has a 1 MHz XO, and a tuning knob that controls a VFO, which is then phase-locked with the 1 MHz XO signal, to get multiples of 1 MHz (1, 2, 3 ... 29 MHz).

The red 'Lock' LED on my FRG-7 is always on. The PLL won't lock, I don't get a stable multiple of 1 MHz but instead the 'multiple MHz' VFO acts as a free-running oscillator.

I don't have much experience with the FRG-7, but years ago we had one (the Yaesu version) at the Hydromechanics Lab at Delft Polytechnical University, and I remember that the red 'Lock' led used to go off when the PLL was locked. Do I remember this correctly? If not, what is the correct procedure to tune a FRG-7? Does the PLL also lock (I think it should) if no antenna (or only a short piece of wire) is connected?

What's the idea with the small button at the right side of the tuning scale (marked 'Tune' and 'Set' if I remember correctly, I don't have the receiver here at the office right now)?

I am especially looking for (copies of) the owners manual and service manual (esp. the circuit diagram) of the FRG-7. Preferably from someone living in the Netherlands. :-)

*** Please reply through Email as well - I can't read the newsgroups often. ***
Any reply greatly appreciated!!

Many thanks for that bit of info Tom. I've been thinking about
adding an outboard bandwsitched input network to my own amplifier.
I wasn't sure how close it would need to be, or if it would even
work properly considering the cable in-between.

Source record: 192766

"Rick Lapp" <rickl@unix.asb.com> wrote:

>Anyone know what the definition is of a "current" balun vs a
>"voltage" balun?

I believe Roy Lewallen coined these terms, so he might be the best person to ask (antenna newsgroup). My own simplified definition would be something like "a current balun attempts to force equal currents into the load, while a voltage balun attempts to apply equal votages."

>Is there a core difference or winding difference?

The windings make the difference, although not all current baluns require windings per se. If a number of ferrite beads are slipped over the end of coaxial feedline where it attaches to the load, the cable + beads creates a 1:1 current balun.

>I have a large qty of ferrite and powdered iron toroids here
>and would like to wind a 4:1 balun for matching a dipole fed
>with ladder line.

Ferrite is the best choice for broadband baluns operating in the range of 80 -10M or 160 - 10M. A balun will not work properly though if the load impedance changes significantly. For example, if your dipole has traps and it's resonant on all the bands of operation, fine. If the dipole is not resonant, the impedance presented to the balun will likely cause it to malfunction on some or all bands. The usual symptoms are power losses, either in the balun itself or elsewhere in the system, or loss of balance (shack RF and/or feedline radiation).

"Rick Lapp" <rickl@unix.asb.com> wrote:

>I'm looking for info on a 4:1 balun for matching a ladder line
>fed dipole to a coax output ant tuner. I have a wide variety
>of ferrite and iron powder toroids with various permiabilities.

There are numerous balun designs in ARRL and other publications.
If you know the characteristics of the cores you have, it
should be pretty easy to determine if they're similar to the
ones shown in the articles.

>I'm wondering if anyone knows why the Radioworks baluns are
>touted as "current" baluns?

Current baluns force equal currents into the antenna. Because
the currents inside coaxial cable are always equal and opposite,
the presence of equal currents also at the antenna means current
is not flowing back down the outside of the feedline (from the
leg of the dipole that is connected to the shield).

On the other hand, voltage baluns do not guarantee equal
currents at the antenna. As a result, their popularity and use
for this purpose is rapidly declining.

Licensed in 1958. Used a Heath AR-3 RX with Q multiplier. Xmtr was a
homebrew 807 with screen grid sequential keying. 80 meter CW only.
Worked 23 countries in one year with 50 watts input. CW forever.

Don't waste money on Bobby's toy... if you want real audio see my article in Jan 86 CQ..."Build the AGC-EQ Speech Processor"... HF/LF EQ and a great compressor. Works fantastic in combo with RF clipping since it keeps the amplitude to the clipper constant for a predictable clipping percentage. Sold lots of kits and never anything but compliments (including some BIG TIME contesters and DXers). I still ship kits (cheap) not to get rich (well, I am already Rich, WB0IKN) but so that I can gloat when I hear one on the air. In fact if you get one and don't like it don't pay me... I also used to manufacture a big dollar multi-band audio EQ/compressor/clipper which still beats any RF clipper... about the same THD but much lower intermod. There I go... rambling on about great audio again.

gimme a mail for any audio questions... I like to pretend.

Oh yeah... also published the first article on a digital voice recorder project in QST back in the days when you had to have oriental connections to buy 256k rams.

pray for spots

You just can't believe anything you hear these days... and I ain't talkin'
about the presidential election... has nothing to do with the operating
point... regardless of where you set your CW/SSB switch on any commercial
linear (and the operative phrase is l-i-n-e-a-r) amp you are running class
B. It simply is to keep the output impedance of the tube at about the same
point in both modes to maintain the Q of the output circuit.

time to whip out the handbook and brush up guys... don't they ask these
sorts of questions on the novice test any more?

Source record: 192778

I haven't played with HT600's but I have done extensive work with the Motorola Spectra's and MTX900. In that case all models have the same RF and controller boards. The only difference is the factory programming. I have successfully turned a trunking only Spectra unit into a conventional by changing model number to that of a conventional in the E2PROM. I had to do this in a debugger by patching the programming software and manually changing the model number in hex. Tedious and I've only done it once. I'd bet the HT600's are the same.... If you run across software that let's you hex edit for HT600 or other mot HT's (specifically MTX900) please let me know. The mot lab s/w will let you do that but I haven't access to it (though I'd certainly work a deal to get it for the MTX900!).

Do you have a manual? It's in there. You turn it off, hold a button down while you turn it on, change it to cross band, turn it off then back on again. You'll have to look in the manual to find the button to hold down - I don't remember - it might be "RPT". Anyhow why don't you use the manual.

I had a friend of mine experience something similar a couple
of years ago. He had a Yaesu FT-757GX HF rig. The unit worked great
until all of a sudden he had no receive and could not figure out what
the hell was going on. He spent 1 1/2 days trying to figure out the
solution to the problem...IE...maybe coax...maybe loose speaker
wire...maybe squelch...and so on.
Well finally the next day after haven taken the rig apart and
put back to together he noticed the problem. He had depressed the MOX
button accidently. He was real embarassed to tell us what the problem
was and once he fessed up to it we named him "MOX MAN" !!!

Take care.

>rich wb0ikn

Hi Rich,

The amount of grid current has a lot to do with class of operation,
although it doesn't determine the actual class. The anode conduction angle
determines the letters in the class, and any change in grid current
changes the conduction angle of the anode in most PA's.

A change in grid current generally changes the conduction angle, even
though it doesn't directly determine the class. It also determines the
subscript, like class AB1 or AB2.

Almost EVERY amateur linear PA is class AB something, not class B. Class B
implys a conduction angle of 180 degrees, no more and no less. It may have
grid current or it may not. Class A is a conduction angle of 360 degrees,
it may have grid current and it may not. Class AB is a conduction angle of
less than 360 but more than 180 degrees, it may have grid current or it
may not. Class C is a conduction angle of less than 180 degrees.

ANY of these classes can be non-linear (even class A), linearity is a
separate issue. A linear amplifier *implys* it is class B through A, but
doesn't tell us what class at all. But being class A does not tell us the
PA is linear.

Actually Rich, you are usually running class AB, NOT B. If there is grid
current class class AB2 and if not class AB1.

But you are right, the reason they switched voltage was to maintain the
same Q at two widely different power levels.

Sounds like you need to replace the variable vco (4)caps with ceramic
ones available from ICOM. The existing ones are plastic and deterioate
with age.

Tom--

Not so Tom. Look a little closer at that $.50 plug and you'll see
that it doesnt fit. The pins on the AMP plug are round and square,
not round and "D" shaped as is necessary for amteur equipment.

This guy is trying to do you a favor although it IS posted on the
wrong group. I'm just curious if there may be other people out there
who you run into trying to help you that you might be missing... oh
well, probably delusional on my part, eh?

I can help a little, I own several Drakes. The socket is for a noise blanker and it is not the same as the R4C, no its not possible to build one there are no parts available. If you want CW I suggest you pick up a TR4CW, it has the 500 hz filter installed. You could probably mod yours but you would trash the radio and ruin its resale value. The TR4's use a 9 mhz IF and are not compatable with the R4B/C's.
Your rf output is okay considering the cost of 6JB6's. New finals will load over 500 ma and give 200 watts out. I suggest you run yours as long as possible, get more for backup, and put a muffin fan on top of the rf cage. There are no useful mods for the TR4 that I am aware of and I have a lot for the C-line. The s meter is scotch but probably more realistic than most. RL Drake in Franklin, Ohio can provide you with a TR4CW/RIT manual for $15.....73 de Gary W8PU. W8PU@N8JSF packet

613. Re: DRAKE R-4C vs R-4B

From: gapoland@aol.com
Message-ID: <53p1d7$mv4@newsbf02.news.aol.com>
Source record: 192799

I have both and like them both. The big difference is that the R4C uses xtal filters and you can add four of the: AM, 1.5 khz, 500, and 250 hz. The R4B uses passive filters. The R4B does sound better than the R4C on AM and has a built in Noise Blanker....just my oppinion....73 de Gary W8PU

```
For Sale
Kenwood TS-830S 160-10m HF Transceiver,
later series with gold nameplate,
s/n 4090058. This radio is very clean,
only a few very light paint scratches
on the top and sides keep this radio
from being "mint"...the front panel,
knobs, digital display, meter, etc, are
all flawless. I do not have the optional
CW filter in it, it has of course a
built-in AC power Supply, all WARC bands,
100+ watts output, etc...i have the manual,
but not the original box.. *** $ 425. ****
I'll go 50/50 on the shipping to 48 states.
I'm willing to give you an on-the-air demo
too, on 160-40m.. or 10m if your local...
I am located in Croswell, Michigan.
---Call Ron N8LMT 810-679-3535
--- or Email n8lmt@greatlakes.net

This may help with your IC-751A

Gary
Most Common Failures and Cures for the Icom IC-751 & IC-751A

*Unless otherwise noted, the following failures and cures
apply to both models.

Symptom: Distorted, or no RX/TX on one or more bands.
Problem may be temperature related.
Probable Causes: 1) Bad trimmer capacitors on PLL unit. 2)
Noisy variable resistor on PLL unit.
Cure: Replace plastic trimmer capacitors C78, C88, C97, and
C107 with ceramic types. Remove excessive wax from around
replacement trimmers to prevent wax contamination. We
suggest using a 12pf trimmer for C97 instead of a 7pf as
listed in the service manual. This will allow you to
properly adjust the HPL lock voltage for that band.
Modification: If variable resistor R43 on the PLL unit is
the 470 ohm type, replace it with a fixed-value 220 ohm
version. If it's the 2.2k type, replace it with a fixed-

value 1.2k resistor.
Remarks: While the PLL unit is lifted, we recommend soldering all joints in the regulator section as this area runs hot. Also, inspect electrolytic capacitors C128, C129, C132, and C137 in the regulator circuit for discoloration caused by overheating. Replace all overheated capacitors to prevent future failures.

Symptom: Erratic display i.e., frequency listed will be out of the normal operating range of the radio. Rotating the VFO knob may cause strange characters to appear in the display. Radio does not work properly. Cycling the power switch a few times may restore operation temporarily. Problem may be temperature related.
Probable Causes: 1) Cracked solder on RAM unit is causing logic errors. 2) Program in RAM unit is corrupted. 3) Burned/overheated R20 on logic unit is causing low voltage in logic unit.
Cure: Check for burned R20 (10 ohm, 1/2 watt) on logic unit. If it looks OK, resolder cracked joints at J1 and J2 connectors on RAM unit, then reprogram. If this does not help, substitute RAM unit with a known good one. If the substitute RAM unit works properly, then the RAM unit must be replaced. If the substitute RAM unit does not cure the problem, there may be noise from the DC-DC converter causing the logic unit to glitch. Follow instructions for "No frequency display" problem.

Symptom: No RX audio in any mode except FM. No TX. Unit is not unlocked.
Probable Cause: PBT oscillator is not running.
Cure: Verify absence of 9.4665 signal at W86 on main unit in 751A, or W134 in the IC-751. Replace faulty X7 on main unit in IC-751A, or X5 in the IC-751.

Symptom: Frequency instability in USB mode.
Probable Cause: Bad trimmer capacitor in BFO section on main unit.
Cure: Replace plastic trimmer capacitor with a 30pf ceramic version and realign.

Symptom: Drastic change in audio frequency response between USB and LSB., i.e. USB audio has too much bass while LSB audio has too much treble. TX frequency response is also poor.
Probable Causes: Misadjustment of the BFO or PBT oscillator, or a faulty crystal filter FL-30 (or FL-80 in 751A) on the main unit.
Cure: Check adjustment of the BFO and PBT oscillator. If these are OK, then the problem is most likely in the filter.
Remarks: If the problem is intermittent, and the radio is

an IC-751 (not "A" version), then the ground return path for the -5 supply between the display and main units may be poor. To cure this, connect a short wire jumper between the unused pin 2 at J2 on the display unit and chassis ground at the closest mounting screw of the main unit PCB. If no spare pin is handy for the connector at J2, the jumper may be soldered to the transformer shield of T1 instead.

Symptom: AC hum or buzz in transmit and receive audio when an internal power supply is installed.
Probable Cause: AC in being induced into the PLL from the AC wires and power supply case.
Cure: Twist the AC wires that run from the rear panel to the power switch and route them away from the PLL unit. Tape them up against the chassis if necessary.
Remarks: In some radios, especially older IC-751s, it is not possible to completely eliminate all AC hum when using the internal power supply.

Symptom: No, or very low RX sensitivity.
Probable Cause: Bad components on RF unit, probable result of RF overload. To verify this, check DC voltages at D47 on RF unit. Correct voltages are: Cathode side- RX: 8.5, TX: 13.8. Anode side- RX: 9.0, TX: 9.5.
Cure: Replace all of these components on the RF unit: D42, D44, D45, D46, D47, Q15. Check C174 and C179 for leakiness. There may be other failures. Unit is not repaired until listed voltages at D47 are correct.

Symptom: Distorted RX on strong signals. BC band RX sensitivity may be low or marginal.
Probable Cause: Q15 on the RF unit has become leaky.
Cure: Check and replace Q15. If Q15 is leaky, there may be other problems on the RF unit. See cure for RX problem listed above.

Symptom: RX disappears when outer conductor of coax is connected to antenna jack. Inspection reveals 6 volts DC at the center conductor of the antenna jack.
Probable Cause: Shorted DC-blocking capacitor C40 on the ANT SW unit.
Cure: Replace the capacitor.
Remarks: There are probably other problems on the RF unit if this capacitor is bad. Check the voltages at D47 on the RF unit. Radio may have been struck by lightning or sustained a large RF overload through the antenna jack.

Symptom: RX cuts out randomly when turning VFO knob in IC-751A with UX-14 installed.
Probable Cause: Incompatibility between UX-14 and 751A is causing the PLL to unlock.
Cure: Turn off transceive mode on UX-14 (bank S1, switch #3

to OFF position)

Symptom: Hash noise in RX, birdies.
Probable Causes: 1) Voltage regulators on PLL unit are oscillating, producing noise on VCC line. 2) Overheated components and/or loose screws are causing the power supply to run noisy. 3) Noisy DC-DC converter on display unit.
Cure: Replace overheated C129, C129, C132 and C137 regulator filter capacitors on PLL unit. Inspect power supply for overheated components and replace them as needed. If the components look OK, tighten the screws that hold down the reg. unit. Don't forget to tighten the screw hidden beneath the wire bundle where the DC output lines leave the case. If none of these help, and radio is a IC-751 (not A version), then the display DC-DC converter may need modification. Contact Icom Technical support for update information.

Symptom: No receiver audio at all in IC-751A. Signals can be seen on S-meter.
Probable Cause: Cracked joint on main unit is causing no VCC the audio amp IC.
Cure: Resolder cracked joint at L46 on main unit. Repair damaged foil trace, if necessary. Re-route ferrite beads so they will not press down on L46 (or any other components) when the top cover is reinstalled.

Symptom: RX audio seems low in IC-751.
Probable Cause: Unit needs update to audio amp circuitry on main unit.
Cure: Contact Icom Technical Support for update bulletin.

Symptom: No TX output in all modes. Problem is traced to no output at J8 on the RF unit.
Probable Cause: Bad Q14 amplifier on RF unit.
Cure: Replace Q14. There may be other problems on the RF unit. Check the DC voltages at D47.

Symptom: Distorted/raspy-sounding SSB TX. Average talk power is low, even at higher mic gain levels. CW, RTTY and FM seem normal. RX in all modes is OK.
Probable Causes: 1) External Astron power supply needs additional RF decoupling. 2) No bias voltage to driver or PA transistors..
Cure: Install RF decoupling capacitors on Astron power supply (if used). If this does not help, measure voltage at bases of driver and PA transistors in TX SSB mode. Should be around .67 volts. O volts indicates trouble and probably a bad Q6. If problem is intermittent, check for bad solder at the legs of Q6, or D2.
Remarks: The driver and PA idle current was set too high at the factory in some IC-751s. (not A version). Align the

idle current as per the service manual after repairs are made.

Symptom: When using an internal power supply, the power to the radio flutters on and off when the TX power output is increased toward maximum. Unit runs fine when the internal power supply is substituted with an external supply.
Probable Cause: Cracked solder in the current-sensing circuit of the power supply is shutting it down prematurely.
Cure: Resolder joints at the .0012 ohm resistor, R26 inside the power supply.
Remarks: This resistor appears as a metal bar soldered to the bottom PC board. Solder the edges of the bar BEFORE the holes at either end.

Symptom: TX oscillations/spurious output.
Probable Causes: 1) Open resistor or faulty electrolytic capacitors on PA unit. 2) PA unit needs modification. 3) Bad drivers or PA transistors. 4) Burned components on the ANT SW unit.
Cure: Check the value of R22 (4.7 ohms) on PA unit. (This resistor may look OK but still be open.) Replace C18 and C25 on the PA unit if they appear swollen or overheated.
Modification for old IC-751: Install a metal film, 220-ohm 1/2 watt resistor parallel to C6 on PA unit if there isn't one installed already. Inspect the D4 area of the ANT SW unit and replace any burned components. If none of these solutions solve the problem, disconnect the J10 on the RF unit and see if the problem goes away. If it does, then there is a problem with the TX/RX switching on the RF unit. If disconnecting J10 doesn't help, then most likely either the drivers or PA transistors are bad, especially if the ALC meter deflection is low.
Remarks: The spurious output may also be caused by incorrect band switch voltage to the low-pass filter unit, or even faulty/burned components on the filter unit itself. The above causes should be ruled out first since low-pass filter failures are uncommon in the IC-751(A).

Symptom: Intermittent low FM TX output power in IC-751.
Probable Cause: Bad relay RL1 on FM unit.
Cure: Replace bad RL1 (221B-D009-M)

Symptom: No TX output at all in RTTY or CW modes. SSB and AM are OK.
Probable Cause: Bad carrier generator crystal on main unit.
Cure: Replace bad X1 on main unit.

Symptom: No frequency display, only decimal points.
Problem may be intermittent or temperature related.
Probable Cause: Display DC-DC converter has noisy output.
Cure: Replace all of the following dried-out electrolytic

capacitors on the display unit: C17, C18, C20, C21, C22, C23, C24, and C25. (These capacitors are light yellow when they are new. Capacitors that have turned brown are old and dried-out.)
Remarks: While servicing the DC-DC converter section, be on the look out for cracked solder joints, as this section of the radio tends to run hot. Also, it would be a good idea to reprogram the RAM card after servicing the DC-DC section.

Symptom: Poor carrier suppression in SSB mode in IC-751. Will not adjust properly.
Probable Cause: Main unit needs factory update.
Cure: Contact Icom Technical Support for update bulletin.

Symptom: Low garbled audio sound in speaker/headphones in SSB TX, even with monitor turned off.
Probable Causes: RF feedback. 1) Inadequate station ground. 2) External Astron supply needs RF decoupling. 3) Main unit needs factory update (IC-751 only).
Cure: Check station ground. If an Astron power supply is being used, add RF decoupling capacitors to output terminals to prevent regulation problems. If the problem occurs in an IC-751, a factory update may need to be installed to the main unit. Contact Icom Technical Support for this information.

Symptom: Radio seems to be stuck in "scan" mode.
Probable Cause: Bad IC2 on the logic unit.
Cure: Replace IC2 (RP5G01-007).

Symptom: Loud, high pitched squeal emanates from inside radio.
Probable Cause: DC-DC converter transformer has a loose core.
Cure: Replace T1 (TO-9) on the display unit.

Symptom: VFO tuning is erratic, sometimes skips when changing frequencies or bands. Display does not increment smoothly when VFO knob is turned slowly.
Probable Cause: Dirty rotary encoder.
Cure: Remove white plastic cover from back of rotary encoder and spray clean the carbon track with Blue Showers solvent. Spin VFO knob vigorously while spraying.
Remarks: Do not let solvent saturate the display unit or allow it to come into contact with the plastic display lens. Stuff a paper towel between the rotary encoder and display unit to catch spray run-off.

Symptom: Missing segments or mode indicators on display. Problem may be intermittent.
Probable Cause: Bad connection between logic and display units.

Cure: Check the connectors J5 and J13 on the logic unit where the flex cables to the display unit are attached. If they look OK, and none of their connector spring contacts flattened, replace the flex cables.

Symptom: Low mic gain when using Heil mic element.
Cure: Install modification: In 751, change value of R264 on main unit to 200k. In 751A, change value of R21 on AF-VR unit to 47k.

618. Kenwood TS-520S For Sale

Newsgroup: rec.radio.amateur.equipment
Date: 1996-10-12 00:00:00 UTC
From: gocial@voicenet.com
Message-ID: <53p3p1$orq@news1.voicenet.com>
Source record: 192804

I have for sale the following:

Kenwood TS-520S HF CW/SSB Xcvr. 160-10M 100W. Includes DG-5 digital frequency display, handheld microphone, external speaker, and antenna tuner (MFJ-948). This rig runs off of both AC and DC.

Includes original operating manual.

Asking $425 (negotiable)

If interested, please Email inquiry to:

gocial@voicenet.com

619. Re: IC706

Newsgroup: rec.radio.amateur.equipment
Date: 1996-10-12 00:00:00 UTC
From: gapoland@aol.com
Message-ID: <53p4kf$o23@newsbf02.news.aol.com>
Source record: 192805

I just picked up a IC 706 used and really enjoy it. I us it primarily mobile but do bring it inside a lot also....I am not a purist, I bought the 706 for its features and small size. The most ovious problem too me is the lack of sensitivity above 2 meters but I knew this before I bought it, I dont need a scanner. (the aircraft band is a-ok though). I have worked all around on HF and Have made my first ever @ meter SSB and meter contacts. The Yeasu is too big and busy....if you split the front panel a lot of controls are left on the main body of the rig.
In comparison I wont spend megga bucks for stereo equipment either, my Pioneer sounds just fine Hi Hi. I sugest you listen to one and make up your own mind...

I heard that the shure 585sa and the electro voice 634a are good sounding microphones. I heard they have a bassy sound? have any of you guys heard thise microphones, So i can get comments on them , and their current price. Right now I run a mc-90 on a kenwood 450. A comparison between those microphones and the mc-90 would be helpfull. By the way my voice is not deep at all, and I am thinking on something that will compensate for that.Thanks in advance.
Carlos

Message-ID: <53p607$ahd@mtinsc01-mgt.ops.worldnet.att.net>
Source record: 192809

HY-Gain Model TH3JR-s Thunderbird Junior ham radio beam for sale.

This beam weighs only 21 pounds and the longest element is 27'3". A
small rotator will work, as the surface area is only 3.35 sq ft.

The beam works great, but I just have not been active for several years
and don't expect to, so I would like to sell this.

First $150 takes it....Too much? Let's talk about it.

E-mail to jimwoodard@worldnet.att.net and I will send my phone number.

I am located in Arlington, Texas.

Hi Ron,

I don't have a FT-8500 (yet) but am considering getting one. The guy in the store didn't know how to activate the cross-band repeater (not a surprise) and this is an important feature for me. I want to use something like a FT-8500 as a cross band repeater so I can get into CalNet South with my HT on low power.

How is CalNet North doing? How is the 900 MHz stuff coming?

Stephen

629. Manuals / Help with Yaesu FTV-107R????

Newsgroup: rec.radio.amateur.equipment
Date: 1996-10-12 00:00:00 UTC
From: slmzc@cc.usu.edu
Message-ID: <1996Oct12.181523.87083@cc.usu.edu>
Source record: 192815

I recently purchased an old Kenwood TS-140, with a few goodies. One is a (also old :-) Yaesu transverter: FTV-107R. Just one problem, tho- I have no manuals, or even an inkling of how to connect the thing! Previous owner has made a mod to the TS-140 to allow use of a transverter-- I think it involved bringing a low-level signal out of the radio just before the final, and then running a resistive attenuating network. In any case, any info. you may have on how to connect would be greatly appreciated. Oh-- the transverter's capable of 6m, 2m, 70cm, although it only has the 6m module installed (as nearly as I can tell from disassembly).

Hello Ken,

I had the same problem in my Icom 761 about 2 years ago. My problem was
a plastic trimmer cap in the VCO circuit that started drifting after
about 1/2 hr of warm-up time. I called ICOM, and they sent me 4 ceramic
trimmer caps to replace all the VCO caps, not just the problematic one.
It was a little bit of effort to replace them, but haven't had any
problems since. Hope this was helpful.

What I think is really ironic is, according to an article published in Bloomburg's Business Briefs, Bell Atlantic is down pushing the Mexican government into permitting little leo activity in the ham bands on Mexican soil. Just think, one of our good American companies down trying to pave the way for the rest of the contient.

What is really interesting is I faxed a copy of the article to ARRL hq and not heard a word about any of it anywhere else.

If anyone is interested, I will publish the source of the data and you guys can go look it up for yourselves.

I'll tell ya where to look, but I don' know about copyrights and stuff like that.

644. Swan Manuals and Service for equipment.

Newsgroup: rec.radio.amateur.equipment
Date: 1996-10-13 00:00:00 UTC
From: KS6Z@sprynet.COM
Message-ID: <326071A8.3A3B@sprynet.com>
Source record: 192679

Hi Lee,

I read your posting and thought that I would fill you in more exactly on the detail of Swan Equipment service repairs and manuals.

ALL Swan Manuals can be obtained from:

Brock Publications
Box 5004
Oceanside, CA.
92052

Phone number for Brock Publications is: (619)757-0372.

Grace Brock is a very pleasant retired Swan employee who operates the manual business out of her home. She is extremely familiar with every model Swan rig and with a question or two can make sure you get the correct manual for the radio in question. There were several radios that had early and late models for instance and the manuals are quite different. The Swan 350 is an example of this. The late model has a green band on the VFO dial and a dial set knob.

The cost of all manuals is 20 dollars and they are complete manuals that include every option that came with the radio.

If you order two manuals (the same or for two different Swan radios she will discount the order by five dollars so two manuals will cost $35.00 plus shipping/mailing cost, naturally.

Grace Brock is absolutely bulletproof when it comes to doing business.

SWAN RADIO REPAIRS WITH THE BEST POSSIBLE QUALITY WORKMANSHIP CAN BE OBTAINED FROM:

Mr. John Bruchey
4901 Verdi Drive
Oceanside, CA 92057

Phone No.: (619)757-4717

John Bruchey is an employee of Cubic Corporation at the present time. He was employed by Swan Radio Company as a senior technician for many years and went with Cubic when Cubic purchased Swan and later closed it down. There is little John cannot do to repair any Swan radio. He knows by looking at a radio if all the mods have been done and unless you have overfused the radio and burned out the transformer or dropped it in the Pacific Ocean he can probably bring it back to factory specs for you.

He has access to most parts or replacement alternatives including matched final amplifier tubes.

He has repaired my old Swan 600 (The twins) and it cannot be told from a new radio either by appearance or operation.

BTW there is no radio alive or dead (including my Drake TR7) that has a sweeter sounding CW note than than the Swan 600.

For some reason Swan owners don't like to part with their rigs and keep them running as backup rigs so they are more likely to spend the money to fix a radio that may not be worth much more than the cost of repairing it. I am one of those people.

On the other hand, you get what amounts to a new radio that puts out several hundred watts on all bands and never really needs an amplifier after John fixes it.

If you own a Swan radio this email is your only known access to the service you will sooner or later need or need now but don't know where to get it.

SAVE THIS AS A TEXT DOCUMENT SOMEWHERE AND CALL IT SWAN.TXT OR SOMETHING YOU WILL REMEMBER BECAUSE IN TIME YOU ARE GOING TO WISH THAT YOU DID!

If you have any questions respond to me directly at KS6Z@sprynet.com and I will try to help out. Keep those old Swans running because when you turn the lights out in the shack at night they look like a real radio and nothing you buy today can make that claim.

73 es CUL

649. Best HF Radio?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-10-13 00:00:00 UTC
From: john@wd1v.mv.com
Message-ID: <john-1310960712400001@wd1v.mv.com>
Source record: 192684

Hi Folks:

This question of which rig is "BEST" points to a real opportunity.

The truth is that no one really knows! We have opinions that are based on impressions - but what about the specifications that we don't know and even if we did, couldn't VERIFY on our own bench?

The ham market lacks a universally understood "RADIO SCORECARD" that are the measured specifications of how well a radio performs. Lacking the scorecard, we lack the knowlege to make good judgements. We go down the rat holes of..."I heard it has a..." or "its such a cool looking thing..." or whatever. The point is, each of us as consumers need better data and better testing of the expensive products whose performance is deemed very important to us. And until we get the data, all we have are subjective opinions.

How much variation is there between radios of the same model? What specific parameters are detectable by ear? How much can some parameters influence other parameters? Metrically, how much better is the best measured than the second best and can humans hear the difference?

There should be a team that creates the "RADIO SCORECARD" (version 1.00)

and then....

A test station that can test radios and create verified "RADIO SCORECARD" metrics. Much later, maybe radios could contain self-tests that make sense to all of us.

This group could create the design of what that scorecard should contain. It would be neat to watch it develop and then see it shared with the manufacturers.

Will radio manufacturers support the performance truth being discovered about their products?

Until we do this, we live in fog, mirrors, QST reviews, and blind faith that the performance we are experiencing is what we hoped and paid for.

If there are 500,000 hams, half of which are active, and half of those in the HF market in the US, we have about 20 - 30,000 people bellying up to the bar of trust each year. We deserve better data about what we are buying!

I think I have a second manual here. I'll have to look. However, it is not the operating manual. I believe it is the service manual. I may have thrown it out a few years ago as I had two of them. I accidentaly ordered a second service manual.

Should I look for it or do you want the operating manual?

Hi all: I'm off to Bosnia for 6 months or so and am looking for the best HF portable I can find that's receive only (I'll be there with the military and they won't be smiling if I'm caught xmitting, so the Icom is staying home <g>).

Obviously, something small and battery operated would be nice.

THe ICF-SW100S by Sony is looking rather attractive, but I've never used enough of those types of receivers to make an informed judgement.

Any comments/suggestions would be nice.

cheers,

john/N9ASH

>
>KE1C - Pat

I started as a Novice in 1959 with a Heathkit DX-40 and crystals on 40
and 15 cw. I built it myself. The receiver was a Hammarlund HQ-140-XA.
A dipole on 40 and a 15 mtr folded dipole were the antennas.

In 1960 I upgraded to Conditional (General privileges) and added an
ART-13 with 200 watts of real AM to the transmitter suite. I still
used the DX-40 on 15 and 10 as the ART-13 did not cover above 18 MHz.

I still own both transmitters and a different HQ-140-XA ---- they
reside in my personal museum...

I Just bought a TS-570D at Ham Radio Outlet in Atlanta. So far like it
real well. The price is $1599 not $1300. You can find all the info on
this rig on the Kenwood web page.

Hello, I am considering to buy a PACTORII unit from SCS GBMH, the PTC-2

See for more information:

http://www.scs-ptc.com/pactor2.html

From this URL I got my information, what I am trying to figure out is if it is really is the very robust digital communication method that they claim it to be, or if it is just another sales pitch.

After all, $900+ bucks is not cheap.

Is there any-one out there that has bought this TNC? What are the experiences?

What are the chances that pactor-II might be licensed out to other manufacturers TNCs like AEA?

Thanks,

Loek d'Hont ldhont@ti.com

Howdy Kieth--

I think you'll have a hard time finding a manual for the SX-60 because
I don't think Halllicarfters ever made a model by that name,
however...

If you check the model number again and write to
Pete Markavage
27 Walling St.
Sayerville, NJ 08872-1818
(908) 238-8964

he seems to have operators and service manuals for nearly every
shortwave piece that Hallicrafters made. Happy hunting.

676. Need help with KWM-2

Newsgroup: rec.radio.amateur.equipment
Date: 1996-10-13 00:00:00 UTC
From: markem@primenet.com
Message-ID: <53rb9q$5cl@nnrp1.news.primenet.com>
Source record: 192711

I'm trying to fix a friend's KWM-2 that just suddenly stopped working. The only output is some milliwatts on a freq about 455kc above the dial freq. The rcvr also seems to be pretty dead...just hiss. It appears that the first xmtr mixer is not functioning correctly but I'm not sure why. The only output from that stage is the VFO signal...I think I should see the VFO freq - 455kc. I can't see any obvious problems...voltages on the tube all look good. The tube has been replaced with a known good one. I'm beginning to suspect that the mechanical filter might be bad. The input to it looks good but I don't think the right stuff is coming out of the filter. Question is...do those filters go bad? What should I see coming out of the filter? I can say for sure,tho, that the output from the mixer is not right. Any KWM-2 wizards out there who can offer any advice?

Thanks & 73... Mark AA7TA

I have owned a FT900AT for some time now and really like it. I use it for what it was specifically designed- a fair base unit that is an excellent mobile/multi purpose rig. I would not buy the IC-706 nor the Kenwood offering for the same reason- too much fiddling with the menus to adjust things on the fly. The FT900AT may have a "busy" front panel, but I don't find it so. Personal preference. I like having quick access to all the commonly adusted things, found it a pain to go thru menus and combo presses to do stuff I could do in 1/10 the time with the FT900AT. On the other side, kudos to Icom for offering a really good unit for those who have the opposite of my preferences/ operating style. I must suggest operating both, read both manuals, pick the one that fits YOU the best.

You might try an Altavista search of USENET. It might seem that
looking for some permutation of HONT or Loenk or some spelling
variation thereof might work; but why don't you search in the
Usenet via Altavista for YOUR e-mail address? Or search for Cubic
on Altavista usenet? You will probably see your post and his reply
there, particularly if it was only a week ago.

Searching Altavista for posts is pretty interesting. You can see
if any of your friends are posting to alt.sex.bestiality or to
bomb.oklahoma.city.again and that sort of thing. Heh heh.

Source record: 192716

Hi Folks,

If anyone has a FT1000mp and a six metre rig can they see if they are picking up a very strong carrier (9+) around 50.158 from the FT1000mp. I have a week old FT1000mp and trying to use it with a 6m transverter is giving me big problems with a 9+ carrier and 10-20khz noise either side. I can hear the carrier on another 6m RX close by without an antenna plugged in in 6m rig and with the transverter totally disconnected. It makes no diifference what band the FT1000mp is tuned to, the carrier is still there. Tapping the FT1000mp causes ringing on the carrier picked up on the 6m rig.

Many thanks

Duncan

Carlos:

For over 50 years it has been known that dynamic mikes,
PA mikes, broadcast mikes, music band mikes, etc. sound bassy.
Most sound systems have "equalizers", ham rigs do not.

If I may suggest that you get one of two mikes. The HEIL
electret mikes are very good; you can get a whole mike or just the
element to put inside a mike whose case or body you like. Or you
can get the headphone with boom mike too. HEILs come in two styles,
one is a not-too-good sounding DX mike that "punches" thru better
but is not so good at casual radio work, and the other is the
normal, or regular one, which is still good for DX but is more
comfortable for regular listening to. (I prefer this second one).

The other possibility is the old Astatic D-104, which has
a crystal element..and might need some sort of matching to your
rig as crystal is very hi-z, like megohms. The D-104 sold today
is often sold with the UG-4 (? UG-something ?) amplified stand and
base. This takes care of the impedance matching and you can set the
output to match the input of your rig. This crystal microphone
element sounds extremely good for communications, not bassy at all,
and it looks just gorgeous in the shack. Carried by Amateur
Electronic Supply among others. I think a gold plated version is
also stocked too, but at gold plated prices (called the Eagle).

I sugest a plain D-104 with the UG-? stand, unless you need
a padded headset and boom mike, then the HEIL is the only sensible
choice.

In theory it should be charged about 9 hours, the battery is 600ma and the chargers is 70ma....600/70=8.57hours so 9 should do it. Keep in mind the book states such things to keep you from leaving it in for really long times. 15 hours just works for them. Over charging can happen yet not unless you forget often. Also you must cycle the battery a few, three or so times before it will work fully. For these, charge the battery 10-12 hours during the first few or so. BTW I have just purchased the same radio for the purpose of controlling my TM-742a and I love it except for the sql. Mine seems to be over sensative even all the way up.

Source record: 192580

HI, I am having trouble with a Ramsey Model FX-50 6Meter radio kit.

Everything seems to work fine except when I transmit the final transistor (Q8) gets very hot and blows in a short time. I have triple checked all of the circuitry in the final amplifier section and there are no shorts or bad parts that I can find. If I remove the final transistor and replace it with a 100pF cap. I can get a few milliwatts out the end from the exciter transistor.

Has anyone ever had this problem? I called Ramsey and they just quote the troubleshooting section of the manual which doesn't say much.

I even injected RF where the transister should be and varied the freq. and looked at it on a spectrum analyzer out the end to see if the output network was working correctly. It seems to act as a bandpass filter just as it should.

I would appreciate any help you may be able to offer.

Thanks,

Scott Sidener N0WFL

696. Trade AOR AR-2700 Scanner for HP200LX

Newsgroup: rec.radio.amateur.equipment
Date: 1996-10-14 00:00:00 UTC
From: woodb@ibm.net
Message-ID: <32621cdb.404820@news-s01.ny.us.ibm.net>
Source record: 192583
Cross-posted to: rec.ham-radio.swap,rec.radio.scanner,rec.radio.amateur.equipment,rec.radio.swap

I'd be interested in trading a like new in the box AOR AR-2700 scanner
for similar condition 1 or 2 MEG HP200LX with documentation.

Reply by email is preferred.

Thanks,

--Bill

SCANNER SPECIFICATIONS

Frequency coverage: 500 kHz- 1300 MHz *
Modes: AM, FM, WFM
Sensitivity: 10-1000 MHz: .5uV NFM
Tuning Steps: 5,6.25,9,10,12.5,20,25
30,50,100 kHz
Memory Channels: 500 total, 10 banks of 50 channels
Search Banks: 10
Scan/Search: 30 cps
Sleep Timer
Optional computer control
Illuminated keypad & display
Optional Digital Voice Recording
Permanent on screen battery indicator
Auto Mode bandplan data (with override)
Size/Weight 153mm(h) x 63mm(w) x 40mm(d) 315 grammes

ACCESSORIES
Comes with rubber duck antenna, telescopic antenna, rechargable
batteries,wall adapter/charger, cigarette lighter plug, belt clip,
carrying strap and earphone.

>for transferring heat.

To get good intermod (and probably 3rd harmonic) performance from a
transistor amp, the bias source must have a very low impedance.
To prevent thermal problems, it must also be temperature compensated
to track the B-E junction voltage of the power transistor.

Probably your device is an IC that has been purpose-designed to perform
this function.
The Motorola "RF Semiconductors" databook has a couple of application
notes describing wideband power amplifiers using transistors, and you
can find bias circuits in there that probably are roughly the same as
what can be found inside those devices.

I love that CQ t-shirt that says "My wife said if I didn't get off of the radio, she'd leave me ... over"

I'm fortunate enough to have a wife and daughters that are all involved in the hobby. We make it a great family activity, volunteering together, being involved with clubs, schools, etc.

Just my $0.01 (after taxes.)

>them in a TS-830s and would appreciate any comments on this subject.

Somebody correct me on this; I should have refreshed
my memory on the recent thread but didn't read it:

6146 the original; in push-pull service must have matched pair
6146A stats improved; still must be matched
6146B stats improved and tolerances tightened; no match required
6146W military version of 6146B. Identical to 6146B.

If I'm remembering this right, you'd do well to pick these up.
Maybe you could check Deja News; I know it's been discussed.

Hey Mike, BTW how about that 830S? I love mine, but just
wish it had general coverage receiver and AM/FM modes. The
variable speech processor and variable noise blanker are great,
and the combination of filters, IF shift, and passband width
adjustment make HF easy and nice.

For a slight power output improvement, substitute a 12GN7 for
the stock 12BY7A. Drop in replacement.

705. Icom IC-2700H Cross band repeater function. Any more special functions?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-10-14 00:00:00 UTC
From: R Ho <dvmrho@hk.super.net>
Message-ID: <32624CC5.38F4@hk.super.net>
Source record: 192592

How to set the mini repeater system. (Cross band repeater.)

- Cut the D14 diode on logic unit.
It is not necessary for USA version.

- Set desire frequency at both band.

With hang up time type repeater
- Push the VHF abd UHF main knobs while puch [SET/LOCK] key
at more than one second.

No hang up time type repeater
- Push the VHF and UHF main knobs and puch [SET/LOCK]+[DUP] keys at
the same time more than one second.

When set the mini repeater mode, flashing "L" display on channel.

How to return normal mode.
- Push [SET] key at more than one second.

I hope the above information is useful for you.

If anyone know how to make a USA version of IC-2700H tune up
to 900MHz, please let me know.

Thank you

Talin Technologies has the following 900 MHz radios returning from a 30
day lease to the 96 summer Games

Kenwood portable trunking radios

model TK-431 with rapid charger and spare battery

we have about 700 of these radios left over
all radios and brand new (except for the 30 use) and come in orignal
packing and carry the full factory warranty

These radios retail for $1195.00

we are offering these radios for $498.00

This is a limited time offer and will only be offered while the supply of
these radios last .

We offer an 5 % discount for quantys of 20 - 50 and 10% off 50 - 100

we also have avaible a 220 MHz radio as follows

these radios are also retuning from a 30 day lease to the Atlanta Summer
games

they also carry a full factory warranty

They retail for $1250.00

While supplies last $598.00

These are really nice 220 mhz radios and can work around repeaters

>
> Randie

These rigs were very popular with CBers. If you're contemplating buying one, make sure it hasn't been butchered by some "screwdriver expert" in some CB shop. -- I'm not saying all CB shop technicians are jerks, but there are many of them who are --. I'd try to find one that's spent its entire life with a ham, on the ham bands.

In the same price range, I'd look for a Kenwood TS-520 or 520S. These rigs didn't work a-m, so they were far less popular with the CBers, and the likelihood of getting a butchered radio is far less.

Other rigs you might consider are the Ten-Tec 540/544 series, Drake TR-4 series, Heath SB-102, HW-104, and SB-104. All of these rigs fall into the "under $300" category (or can be found readily in that range). The Ten-Tec rigs and the Heath 104's require 13.8 VDC supplies.

Source record: 192601

Hi Folks,

The answer to the above is that the processor runs at around 25Mhz. I am seeing a very strong harmonic and I could just be very unlucky that my FT1000mp is a bad one. The frequency varies rig to rig but is around 24.9-25.1. If you are unlucky it could wipe out 12m. My fundamental on approx 25.07 (drifts high) is about S9 on the FT1000 receiver itself with major noise plus/minus 20-30khz.

I went through all this with the connectors and over priced cords. You
CAN buy the connectors direct, I don't recall the price but I bought
a whole bunch of them for $10 or something a while back......
ICOM sells them, call the 800 number to order the plug and the
pins quite cheaply and direct.

In 1957, dad and I heated a soldering iron on the kitchen stove to build a Philmore 2-tube plus rectifier BC and shortwave regen receiver, 6 - 18 Mc. I listened to 40 and 20 mtr a.m. boys, then got interested in cw. What excitement to hear Radio Moscow direct before Sputnik and Telstar. -Dan, K8JWR, licensed in 1958.

>

The first successful radio I built was a "tapped-coil crystal set" from
an article in _Popular Electronics_ ca. 1958. I substituted a 1N34 diode
for the galena crystal, and added a CK722 transistor amplifier from
another PE article. It worked great! I could hear and separate most of
the AM BC stations in Louisville, KY. The biggest thrill was detecting
a very loud AM signal from the ham operator in my neighborhood!
That helped launch my electronics career.

One other thing.. re batteries- I currently have a 7.2V 600 mAh battery, (Yaesu) and a 7.2V 1200 mAh battery (aftermarket). My charger is a simple Yaesu wall charger rated 13v 45 mA.

Q: I was told that this charger cannot charge a 12V battery pack- is this true?

Q: Math seems to indicate that this charger, at a maximum current of 45 mils, would take at least 14 hours (probably more like 16) to charge the 600 mAh pack, and twice that for the larger pack. Is this correct?

How long should the packs be charged for?

Is it ok to leave them connected longer? Is it ok to run the ht with the charger connected?

Last but not least, does Yaesu use the same batteries and chargers for their new radios (ie if I buy more batteries and/or a drop-in charger will my investment be a good one)?

Thanks very much!

Add a Plectron or Motorola Alert
Crystal Controlled Monitor Receiver
to Your Scanner Collection

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author.]

In the 1960s and 1970s, thousands of firemen and ambulance squad members came to rely on their transistor Plectron and Motorola monitor receivers. They have now been replaced by portable pagers, and are often available at hamfests in the $5 - $25 range. Since many are in rough condition and need repair, a hamfest special is better suited for hobbyists who like to fix their own radios.

Plectron and Motorola crystal controlled receivers are excellent for dedicated monitoring of local frequencies -- a task for which you wouldn't want to tie up your 400 channel programmable scanner. They can be powered from 117VAC or 12VDC with the proper mobile cord. The audio quality of a Plectron P1, Plectron 700 series, and Motorola Alert Monitor is far better than any consumer grade scanner and the sensitivity, image rejection, and intermod immunity is outstanding when aligned properly.

The Plectron and Motorola Alert monitors are single band receivers: VHF-low, VHF-high, or UHF. No single Plectron or Motorola Alert monitor can cover the entire 30-50 MHz band, so there were versions optimized for each portion of the VHF-low band. There were different versions to cover low and high "splits" in the VHF-high band, too. Although UHF versions were made, they are somewhat rare and coverage is limited to 470 MHz and below.

Plectron made several models with dozens of different options. Both the original P1 and later 700 series are suitable for restoration, although I prefer the newer 700 models. The Plectron 500 "economy" series is less desirable.

The P1 series have black cabinets with a blue-green and silver color scheme used on the front panel. They were made in the Chief (tone decoder & carrier squelch), Patrol (carrier squelch only), and Sentry (tone only) models. The Sentry models lack a carrier squelch and therefore are of little use to hobbyists except for scavenging parts. Model number and frequency information appears on a gummed label on the rear panel:

Band (MHz) Chief Patrol Sentry

_____
25-54 R19 R15 R17
148-174 R20 R16 R18
450-470 R23 R21 R22

Table 1. Plectron P1 models

The R700 series have black cabinets with brown front panels and are slightly smaller than the P1 receivers. R700s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

_____
25-54 R719 R715
148-174 R720 R716
450-470 R723 R721

Table 2. Plectron 700 models

The Plectron FM Receiver/Recorder is a collector's item. It is essentially a 700 series Chief receiver with a built in cassette tape recorder. The recorder is carrier activated and can tape transmissions while the receiver is unattended. A connector on the rear panel allows for all kinds of remote control possibilities.

I use two Plectron P1s and four R700s in my living room, seven R700s down the basement, and several Plectrons and Alert Monitors stored in reserve. The basement Plectrons are turned on automatically when someone walks downstairs. Power to them is controlled by a modified Radio Shack Safe House infrared motion detector, originally sold as an intrusion alarm.

When a rescue squad member from Missouri advertised a number of Plectrons on USENET, I bought them -- all 20+ of them. I cleaned, fixed, and restored each one. After recrystalling them on local frequencies, I distributed them to members of my scanner club who were glad to get them.

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies

far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency.

AC power cords for both types of receivers use unique connectors and are scarce. You can buy them new but it's much cheaper to drill a hole on the rear panel and attach a permanent a power cord. Make sure you use a grommet in the hole to prevent the metal chassis from chafing the line cord.

Many Plectrons and Alert Monitors were equipped with an internal NiCd battery pack, intended to power the receiver if the AC power fails. It's unusual to find a used monitor receiver with the NiCd pack still capable of holding a charge. More often, the batteries have died and the series charging resistor has overheated and burned. Be sure to remove the dead batteries as they often leak.

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

I have not used the Plectron tone alerting features so I cannot address that except to say that the special coils and capacitors for the dual tone decoders vary depending on the tone frequencies and are somewhat difficult to obtain. Repair service for the Plectron P1 and R700 models is offered by:

Woodson Electronics
Plectron Place
P.O. Box 960
Imboden, Arkansas 72434

telephone 1-(501)869-7985

Some replacement parts are currently available from Federal Signal in University Park, IL, phone (800)524-3021. You can also get Plectron repairs and parts from:

Northeast Communications
4 Oak Ridge Rd
Newfoundland NJ 07435
201-697-8804

Alert Monitor parts are available from Motorola. Phone (800)972-3226.

I currently have no Plectrons or Motorola Alert Monitors for sale. I'm hoarding them. :-)

Hi all.

I just got a used Yaesu FT-530- first 'fancy' HT I've had and it's not quite obvious how to work it. Any help (direct information, pointers to web pages, etc) would be greatly appreciated!

Here's what I have figured out so far (I think- please correct!):

-'Band' controls which band you transmit on and which band (some???) settings will affect.
-'F' by itself puts you in direct entry mode?
- When you aren't in direct entry mode, the blue legends apply.
- 'Tone' selects 'no-pl', 'TX only pl', 'RX and TX pl'.
- 'T Set' selects the pl frequency.
- Holding down arrow keys causes radio to seek.
- 'Set' maps the other keys to a mode where other strange parameters are set.
- 'Rpt' enables standard TX offsets.
- 'Clock' displays and sets the clock.

With this knowledge, I have been able to get the radio manually set up to a local 2M repreater, set a -600 offset, set my transmit PL to the proper frequency, and successfully communicate. But I'm constantly struggling with strange modes and settings!

What I need to know now is (besides everything)-

How do I save and recall memories?
What does 'A, b, and C' do?
Can I scan memories? How?
How do I switch the dial between VFO type operation and memory select mode?
What does the VFO button do?
What is 'Rev'?
What is 'Sub' and 'Sub Op'?
What does 'Alt' do?
Are the memories separate for each band? Or, if I program #1 for a 2m configuration and #2 for a 70cm configuration, will the band selected for transmit change with it?
If I'm only interested (usually) in working one band at a time, can I mute/shut off the other band without playing with the volume and squelch?
Can the above be done under memory control?

Also, besides the extended receive and transmit (which I have figured out), what other tricks does this thing do?

I know there are a lot of questions here- I do plan to get a manual but would like to be able to do the basics now.

If anyone has this radio (I know it's fairly common), and you are willing, I would be willing to give you a call on the telephone if you could lead me through the basic logic of the controls. Once I have that I can play with it and learn the rest...

Thanks very much!
Ben Mehlman KB2ERP

Hello,

I have a friend of mine in Peru who has no access to the Internet.
However, he is interested in ham radio and asked me to find out
about the prices and other pertinent information about the following
four pieces of equipment

YAESU FT-890AT Compact HF Transceiver
YAESU FT-840 Compact HF Transceiver

KENWOOD TS-140S HF Transceiver
KENWOOD TS-50S Super Compact HF Transceiver

Do you know how much these transceivers cost?
Are these transceivers still available?
Do you know where I can purchase them?
Which is the best transceiver?
How big are they?
How much do these transceivers weigh?

Any and all information is greatly appreciated.

Thanks!

I have one of these but do not have the info you're
looking for with me so I can't be specific.
After power up you enter a six digit code and the
xmit/recv range is extended.
If you don't have the code, e-mail me and I'll hunt
it down for you.

It will be some form of regulator. The simplest explanation is that the module contains a variable voltage regulator the output of which is governed by the 200 ohm pot. Thermal tracking to prevent runaway and maintain bias with device temperature is ensured by the package bolted to the heatsink having some form of temperature sensor.

Unless you really need class A, this device will be appropriate for good AB1 linearity.

Getting rid of the 3rd harmonic is best done with a filter, not by bias.

I never saw an answer to the subject question.

Don't know the exact answer, since an auction would be involved, but it would be safe to say that exclusive licenses for the 4 MHz of the current 2m ham band (on a nation-wide basis) would likely be worth at least several BILLIONS of dollars ...

The 70cm band with its wider bandwidth would likely be worth SEVERAL TENS of BILLIONS of dollars ...

>thinging about buying one and would like some info.
>Thanks..in advance.

Edwin,

Unfortunately ICOM has a hidden software that makes the radio fail when
used on certain CB frequencies.

It makes the transmitter transmit into the microprocessor, and blows the
radio up.

I wouldn't recommend the 706 for CB use because of that, you might use it
with no ill effects, or it may blow out right away.

> Good luck, Greg K3EWZ

Guys, I just bought the 50-foot Rohn telescoping mast, and
the price came in very close to the Radio Shack 40-foot model.
Mine easily supports a Mini-Quad (15 pounds) at 35 feet, with
support halfway up at the roof gable endwall.

Keep it light, and it will work fine. You'll need one set of guys
with the setup you are contemplating. I recommend drilling
through the mast at each joint and installing a through-bolt.

Check the prices in all the Catalogs for a Government version R-7000.
Then see if you can become a government (so you can buy a non-blocked
version) then get back to me. Was it overpriced as new? YES. Is it
overpriced on the market? NO! I have one also, and I wouldn't dream of
spending $900 for a second one, but if I didn't have one, and wanted one,
I wouldn't spend 1300 for a blocked version.

>>the way for the rest of the contient.

I don't think it would be possible for the LEO's to take over the 2 meter
band in this country. There must be tens of thousands of HTs out there.
I suspect these units would be sold to unlicensed users or just used
ilegally and the 2 meter bands would sound like CB radio. How would the
LEO's work with all that QRM? Are the LEO companies going to buy back
all the HTs out there?

I don't think so...

Although I cannot help you with your information, I wanted
to send you this note and apoligize for Kory. The Citizen Band
situation, here in the US is a BIG problem and the FCC appears to
have washed their hands of the situation. The amateur radio population
is the only defense against having these pirates take over our
bands. I suppose Kory missed your call sign and over reacted.

765. Re: Help re simplex mode for high speed modem

Newsgroup: rec.radio.amateur.equipment
Date: 1996-10-15 00:00:00 UTC
From: Tom Holden <tholden@toronto.cbc.ca>
Message-ID: <3263EBE8.2139@toronto.cbc.ca>
Source record: 192651
Cross-posted to: comp.modems,rec.radio.amateur.digital.misc,rec.radio.amateur.equipment,rec.radio.amateur.homebrew

Thanks to all who offered advice on my question.

In summary,

1. The designer of the Hayes Smartmodem 300/1200 modems and of the original AT command set confirmed that it was his intention to support a unidirectional test mode but is unaware that it was supported in subsequent Hayes modems or in thos eof other manufacture.

2. I have learned that high speed telephone modems go through an essential 'training' phase which, of necessity, requires a bi-directional path for negotiation.

3. Fax modems have been used for unidirectional data transfer at speeds of up to 9600 bps (V.29, V.27), in particular in Japan. A reference to the Japanese Packet Radio Users Group (PRUG) failed to turn up any further info.

4. Suggestions:
- use a short-haul 4-wire modem
- develop hardware/firmware specifically for application

Thanks to Rob Janssen, Jeff King, Gary Coffman, Dale Heatherington for the informative news posts and/or e-mails.

Regards,

Tom Holden, VE3MEO

-->Last but not least, does Yaesu use the same batteries and chargers for their
-->new radios (ie if I buy more batteries and/or a drop-in charger will my
-->investment be a good one)?
-->

The answer to this question is that the batteries for the newer radios like
the 51 and the 50 are completely different. The fast charger is also different,
and you buy adapters for the newer different battery packs.

I think they break even on the rigs and make the big bucks on the batteries, chargers,
speaker mics etc..... Yeasu even has different AC adapters for each different battery
pack voltage so if you do go the cheap slow route, you'll need multiple wall warts also!

Now that the dollar is work 112.25 yen (last check), I wonder if the prices will go down
on the Japanese radios. Remember how they blamed the last price increases on the exchange
rate when it got into the low 80s, upper 70s? Now the dollar is worth 25% more yen than
back then.

775. AES,Tucker,Ham Radio Outlet???

Newsgroup: rec.radio.amateur.equipment
Date: 1996-10-15 00:00:00 UTC
From: swizdor@auburn.cayuga-cc.edu
Message-ID: <5413e7$d6s@snowball.hscsyr.edu>
Source record: 192661

I forgot Ham Radio Outlet as one of my selections of a mail order company, as one responder to my question said "sorry". Anyway here's is what I have so far for the Alinco 582:

AES--319.00 plus shipping 9.00--Total--$328.00
Tucker--329.00 plus shipping 8.00--total $336.00
Ham Radio Outlet $319.00 --NO shipping---Total $319.00

So it looks like HAM Radio Outlet for me, so far, for a few reasons that many of you responded to my question earlier. Very friendly on the phone, said goodbye to me, when the others did not say this, they just hung up when I said thanks for the price info, but I'm not ready to buy yet, they have 12 stores around, this must mean they are doing well, because if they were not a good company, they would of been out of business long ago.

Anyway If anybody has any comments on Ham Radio Outlet
good and bad, PLEASE let me know before I order.

THANKS and "73" Stan

Ah.... Sergeant Kinchloe was the radio guy. Carter was the bomb guy. :-)

Good luck. I enjoy building things when I have time, but unfortunately
it's RARE that I have much time for building nowadays.
Sixty dollars is a shade low for a budget (a good receiver is the trick),
but it's not impossible.
Of course, what you are doing would hurt your chances of getting into the

From: craigivey@aol.com
Message-ID: <5418rf$psl@newsbf02.news.aol.com>
Source record: 192664

I'd like to get some info on working microwave EME. (Yeah, I know, EME is not as easy as it sounds.)

What would it take to use the microwave band(s) with EME?
How much power would I need?
Is the equipment readily avalible?

Please reply via e-mail.

Thanks,

Craig

Yes, I understand this is true and it's done on a "coin toss" basis. Your 706 may go for months until one day, poof! Hats off to Icom for thinking of this.

And for all the rest of you who are thinking of transmitting on all kinds of non-hamband frequencies, Keep in mind that the radio's output filters were designed for a specific range of frequencies thus when you transmitt on some out of band frequency, anything might happen such as final blowing, swr/power detector diodes popping etc. So do so at your own risk!

: Unfortunately ICOM has a hidden software that makes the radio fail when
: used on certain CB frequencies.

: It makes the transmitter transmit into the microprocessor, and blows the
: radio up.

: I wouldn't recommend the 706 for CB use because of that, you might use it
: with no ill effects, or it may blow out right away.

From: k0jv@juno.COM
Message-ID: <19961015.190840.5399.0.k0jv@juno.com>
Source record: 192667

I have a HAL CRI-200 RTTY/CW Interface that I need some software for, preferably shareware/freeware. I can buy the original software from HAL for $99 but I can't really afford that so am wondering if anyone uses this unit and what software they might recommend that will work for both CW and RTTY. At present, it will work on RTTY with KF4NB's RTTY v1.2G but I can't find anything (yet) that will do both modes.

In other words, HELP!

Thanks to all

>Mike - WA8MSF EM79sd
>

Hi Mike,

It's a real pain isn't it! I've just sent mine back today to see if they can sort anything. Yaesu's official line appears to be that there are no birdies on any band it was designed for. If that is the case why put in the provision for setting the display to 50Mhz when transverting? It isn't very satisfactory. Here it ciovers up the Eu DX portion of the band. It's even more annoying 'cos I spent most evenings last week putting a 6m transverter kit together specifically to use with the FT1000mp intending to sell my TS670 which I currently use. Only when testing the transverter did I actually have TS670 on at the same time as the FT1000mp. I'l let you know what happens but I suggest any prospective buyer of an FT1000mp who uses 6m checks it alongside a 6m rig first.

Duncan

My mind's made up. Don't confuse me with the facts!

Bill, the problem is most likely in the squelch hibrid. I've got a
couple of tac200s left with good receiver boards. I'll sell you the
whole radio for $25.00. I,ve got a complete service manual for that
radio but I can't let it go because I've still got tac200 repeaters
on the air. I will copy the schmatics and enclose them with the radio.

>Has anyone ever had this problem? I called Ramsey and they just quote
>the troubleshooting section of the manual which doesn't say much.

I had the same problem, as did a cow-orker who bought one. When you use tons
of solder to mount the final, some of the solder wicked under the transistor.
I removed the transistor (thinking I had blown it soldering it in) and when I
replaced it, everything ~worked~. (Tilde {~} added to express sarcasm). BTW -
In violation of their recommendations, I used my Big Bertha(TM) 240W soldering
gun to mount the transistor to the board. Didn't hurt the part. Kept me from
having to use too much solder, the case of the part and the top of the board
were properly heated.

>
>I even injected RF where the transister should be and varied the freq.

One you get it working, you'll find you'll need that specan again - Add an
output filter, or tune for minimum splatter, not maximum output.

Yes it really does. I bought one at Ham Radio Outlet last week. Sorry I
can't help with the clear image. you can find an image and lots of info
at http://www.kenwood.net
I am likeing mine real well SO FAR. I don't talk very much so it will
take a while for me to really test it out good.

->I forgot Ham Radio Outlet as one of my selections of a mail order
->company

I've come to really appreciate a company called Ross Distributing up in Idaho. Their prices are competitive, they are really quite helpful, and a plus in my mind is that they won't sell to you without confirming that you do have a license and that they are shipping to the callbook address. Nice folks. See any ham magazine for the phone # (I've been trying for MONTHS to get them to have a website).

My UK agent is complaining strongly to Yaesu and they suggest that you
do likewise especially as the manual shows how to connect a transverter
etc. The agent has found that the microphone connector has a lot of
links direct to the cpu and the mic lead/mic radiates most of the hash
(presumabley because of the up/down buttons) although a lot still comes
through the front panel. I use a Heil boom microphone but it could be
much worse if I used the supplied Yaesu microphone.

I'm surprised the magazine reviewers didn't pick this up. I would have
probably avoided the FT1000mp if I had known. If it had been picked up
in a review I'm sure something would have been done by Yaesu.

Unless Yaesu are made aware by complaints they may not act fast. So kick
up a big fuss and demand action direct to Yaesu US. maybe we will get a
fix.

Best regards

Duncan

Thanks to your suggestion, I found out exactly what this part is. Note, it was obvious that it was some kind of bisaing component, but what exactly - and thereby how to use and set it.

The products are now manufactured by GHz Technology, Santa Clara, CA. The parts are diode-connected RF power transistor biasing networks. The BYI-1 is basically a diode (neg voltage TC) with a 0.7-ohm series resistor (pos TC) to provide about 1-ohm "dc" source impedance to the RF transistor(s).

The ZO-28/F in my amplifiers is more complex. It has a 2-diode string (to GND) to establish the bias voltage, with an emitter-follower to provide the desired low-Z source impedance (0.6 to 0.7 ohms) to the RF transistors. According to the data sheet, the part can consume up to 0.5A, which I observed.

Hello.

Many years ago (probably around 1983) I picked up a modified LCL CB rig. It has performed well enough over the years, however, I dug it out today and found that the transmitter synthesiser would go out of lock shortly after keying up. Monitoring on my FT107, I also found that perhaps half of the time it come up 10 kHz high.

I know there were a couple of articles published early on in the 80's for this radio (and one like it that I can't remember the name of), and this particular one was modified at the CQ Centre in Merton. I think they shut up shop before I emmigrated to the Good Ole..., so trying to contact them would be futile.

Does anyone happen to remember the articles? I think they were in Radio & Electronics World, but it may have been PW. If anyone can help, particularly in describing the procedure to retune the VCO to 29.6, I would be most grateful if you could email it to me. I don't need much more than which coil('s) to tune, and the pin to watch on the synth chip for the PLL Lock condition.

Thanks in advance.

From: akent@bga.com
Message-ID: <543q3c$141e@news3.realtime.net>
Source record: 192555

I just finished building my 1220, and found a potential problem for anyone who has built one.

The T/R switchboard (the one that is mounted to the 239 connector) had a very small amount of copper on the board's outside edge that was shorting the transmit coax together. It was interesting, because when I was testing the unit with a dummy load and an SWR/power meter, there was not much power. It read about .4 watts in high mode. I took the unit back apart, and checked everything. All looked perfect. I got out the trusty ole multimeter and found the short. The trace causing the short is very small. I am shocked that it could put out any power at all with that short.

Once cutting the trace, I could key a local repeater with just my SWR/power meter into a dummy load! After tweaking the coils, the unit puts out a solid 5.5 watts, stock.

I must say that this is a minor problem from Ten Tech. All in all, the unit is exceptional. The kit is very well designed. Whoever layed out the PCB deserves a big pat on the back. It is one of the nicest layouts I have seen for such a dense mixed signal PCB.

I just wanted anyone with one of these units that has any kind of range problem to be aware of what I found.

BTW: The unit has REALLY clean signals. The harmonics on mine are more than 65db down. Receive sensitivity is very good.

I plan on asking Ten Tech for the source code to the processor. I believe that I can perform a mod to include scanning capability! Anyone interested?

Kent

You might also consider sales tax in your comparisons. If the company buy from has a presence in your state, you will most likely have to add sales tax to your cost, if they are not in your state, you may not have to pay sales tax. At least that's the way it works in California.

Source record: 192561

I have a 706 in my car. It is sometimes useful to listen to CH 19
for 'live' road/traffic reports. Given the FCC's stance on CB band, I
don't understand why, if ICOM would go to any trouble to make operations
on CB freq's different, why they just wouldn't push the transmitter to
legal power limits only?? There is no need to do stupid foolish things
such as you approve of.

From: drunyon@abcs.com
Message-ID: <32666990.0@dns2.abcs.com>
Source record: 192323

Okay folks...I've asked this question before, but didn't really get any specific answers. Here goes one more time...

I have a Yaesu FT-50 that I using primarily as a scanner (works great for that purpose). I have approx. 70 channels I scan. I want and need to have the radio scan and also monitor (like a priority) the first memory channel for activity. Many of you have suggested that the dual watch feature will accomplish this, but I can't seem to get it figured out.

If anyone has specific knowledge as to whether this is possible and how to accomplish it, I would be grateful. For the record, my radio has all mods and I do have the software.

Please "cc" your answer to my e-mail as USENET newsgroups aren't very reliable and I don't want to miss your answer.

Thanks in advance,
DOUG

Hello all Richard KT4IJ here. I am going to try the qsl industry a
bit. I can make and sale custom designed QSL cards for about
30 cents a piece.. They will be printed on photographic paper
<heavy stock> and can have graphics like your call and the
QSL info put on there along with a picture of you in your shack
or your tower or whatever photo you would like to see on the
front of your QSL!! Custom designs avaible. You can even recieve
your proof via e-mail and make sure it is what YOU want before
they are printed!!! Sound good? E-mail Zepplin@TRELLIS.NET
for the info......coming soon a web page with examples to browse
thru'!! Thanks for your intrest....

30 feet? That is not very high. A push up mast of the Radio Shack
variety is pretty flimsy and will need guying for sure.

May I make a suggestion? Use a heavy steel pipe. Have it from the
ground (no concrete neccesary, just lay on top of a pland with
some sort of rod thru the wook, sticking 12" above, and maybe
3 feet into the ground. Slide the pipe over it. Clamp it
well to the house, at the 12 ft level like you said. The pipe
should be long enough to clear the roof line of the house. Put
a ladder that will reach up there so you can go up and down.

Let's say the bottom pipe is 15 ft long.

Take a second pipe, somewhat longer, say 18 ft or so, but one size
smaller diameter, and slide it INTO the first pipe. Notice that
since it is longer it will stick up 3 ft or so above the first
pipe. If your roof was at 15 ft, your second pipe will stick up
3 ft above the first. Mount the rotor and antenna on this.
Now, pull the pipe up and when only 3 or four feet of overlap
remain, drill a hole thru both pipes and stick a bolt in there.
Maybe two holes and two bolts for safety.

Naturally, you do not really drill holes up in the air like that,
but actually put it all together on the ground, antenna, rotor,
holes etc. Swing it up into position using block and tackle
to the gable of the roof. Once there, use a gin pole to
extend the inner pipe up. The gin pole is a short pipe, maybe
6-8 ft long, 2" water pipe is fine. You clamp this to the
outer pipe sticking up a ways, and put a pulley on the end of it.
A rope goes fron ground level, thtru the pulley, and then a
fisherman's hitch to the inner pipe. Then pull the rope, and
slide it all up. When the knot gets to the pulley, put in
a bolt (you drilled for this too, eh? ! :-), undo the rope,
retie the knot and continue.

You can do without ropes or knots too. If the inner and outer pipes have say 1/2 clearance, you can slide a steel cable or wire rope, say 1/4 diameter from a pulley on the top of the outer pipe to the bottom of the inner pipe. Then pull it up from ground level. A $20 trailer winch works fine, or maybe 4-5 friendly hams!. You still need the bolts for safety, and so the thing stays aligned to North.

If you have a welder, weld a couple of tabs to the inside of the outer pipe, just at the top to keep the pipes from pinching the wire rope; and on the inner pipe, on the outside of the very bottom, do the same. The pipes will then slide without chafing the cable. A welder is nice 'cause you can weld little brackets for the pulleys, etc.

This is a cheap man's crank up tower. Adequately painted, it will look okay. I suggest primer gray for the part above the roof, and the color of your house for the part below. Primer gray is a light gray color, make it light or it will stand out against the sky. Too light, will also stand out. Use your noggin' here.

If your pipes are, say, 4 inch outer and 3 inch inner, it should not need guys and will never break. I would be pretty confident too with 3" outer and 2.5" inner. 2" inner is probably not capable of sticking up 16 to 17 feet without kinking on a wind, but if you built the cable winch system, just lower it down when it threatens to blow.

The cost differential of the larger pipe 4 and 3 or 3 and 2.5 is worth the peace of mind, and the cost of fixing something if it should buckle. For this reason, I would use 4 and 3. You will need a reducer on the top of the inner pipe, or a flat plate welded to it, and drilled for the rotor.

By tapping your antenna tuner output about the 10 ft or higher level you can use the whole thing as a nice vertical on 160, 80 and 40 meters. You could extend the tap with coax. Just bring the tap wire down to the base, and then lead away with a single wire to tuner or a coax to the tuner. Changing the tap height might give you better results, depending on tuner.

Always bring all rotor cables and coax wires to the BASE of the mast before you lead them away, or it won't work as a vertical.

For ground, you will need wire radials. If 4 or less, need to be 1/4 wqve long minimum. The more you use, the shorter they can be. I guess with 15 to 20 such, 20 ft radials will work on the three bands in question. Bury them if you can. Galvanized electric fence wire, or plain galvanized wire is excellent. No need for copper here. Bring them all together at the base of the pipe, twist them all toghether there in one giant spiral, and take your torch and solder them together. Then ground to the mast. If you weld a tab with a hole in it, you can then bolt the ground

to the mast. Else, put a giant muffler clamp on it and pinch the wire to the pipe. Not only is this a good radio ground for use as vertical, it makes a mighty fine lightning ground too.

Winch can be bolted to the house, or bolted to a plate welded on the mast. The house gable should be reinforced. Typically a 3 x 8 inch lumber spanning at least 4 wall studs is fine. Use threaded rod of 5/8 diameter with locknuts to clamp the pipe to the house. If your roof has an eave, you need a spacer. Lumber works fine for this too.

If your gable end is weak, consider running some 2 x 4 under the attic rafters to meet the cross brace at the ends. Fasten them all together at the ends with any kind of metal bracket. A chunk of steel angle or aluminu angle 2" side x 1/4 thick makes a fine bracket. Use bolts with locknuts. I alway use locknuts in ALL antenna work. Antennas vibrate, that is what they do. It often will loosen hardware and pieces fall off. Maybe your gable.

With the mast described, you will notice that US Tower, Rohn etc sell similar for hundreds of dollars. This one you should be able to build for under $100 to $200 depending how well you scrounge, buy new or find a friend with a welder or have welding skills yourself. It will be just as good. Those fancy masts are built exactly the same way, except they have welded guides so the bolts to hold the pipes are not neccesary; but the weight is on the cable which is not too good. I like to leave the cable snug, but not tight (put the bolt and slacken a click or so on the winch so it is not bar tight). Then if something were to happen to the bolts, the cable will serve as a safety.

Last thing. Pulling the pipe up and lining up the holes is hard. If you drill a hole in the inner pipe just even with the lip of the inner pipe, you can raise the mast a few inches extra, put this bolt in, and lower until the inner mast rests on the bolt. If you mark the outer mast, the holes will line up. Or you could even file or cut two slight notches so this alignment bolt drops into the notches and holds things in the right place. Kinda handy when you are raising the antenna at night.

There would be nothing wrong with doing it Rohn's way. Just weld a small square rud the length of the inner pipe, and a little guide on the inner face of the outer, to keep things from turning. But I still like the bolts better. Don't make any of these bolt holes too big. 1/2 to 5/8 is plenty. Use a grade 7 so it don't bend on you (220,00 psi steel). Too big a hole weakes the pipe right where the stress is maximum. For this reason, put your bolt holes one at the bottom of the inner pipe, say 3" up, and the next one about 6" above that.

If you worry about the pipes wiggling around from side to side, a wood or steel wedge is in order at the top lip. If steel, it can fit with 1/8 clearance which will be negligibel sway.

I built this contraption myself in 1972, but instead of standing it on the ground, I strapped it to the top of a 40 foot utility pole. Scary! Later replaced with 102 ft self supporting tower, which, alas, when I divorced was gotten rid of. Using a dipole now. Grrrrr. Maybe I'll build something like this again, but in myh case I have room for tower, guys, etc. So, maybe not.

Good luck.

FOR IMMEDIATE RELEASE

FOR FURTHER INFORMATION CONTACT

John F. Holloran, Jr.

(214) 348-8800 x8363

jholloran@tucker.com

DALLAS, October 16 - Tucker Electronics Company, a distributor of new and reconditioned electronic test & measurement equipment, amateur and shortwave radios, and electronic hobbyist products announced today it had agreed to sell substantially all of its assets related to its amateur radio business to Ham Radio Outlet ("HRO").

Tucker Electronics has discontinued operations of its retail store and consumer mail-order business, and the company will immediately begin to transfer the purchased assets to HRO's stores. Tucker plans to market its vintage radios and any inventory not acquired by HRO on its website (www.tucker.com) in early November.

The sale of its amateur radio business will allow Tucker Electronics to focus on its core business, distributing new and reconditioned electronic test & measurement equipment.

I've used the T-1000 and have no complaints. I'm told it has the
exact design as the MFJ only a different case and label (and this
comes from a friend who works for MFJ).

The tuner should work fine on 10, 18 and 24.5 MHz bands. Are you thinking of MARS coverage ? If so the tuner will not work in the MARS frequencies. it has to do with the way ICOM chooses to handle band switching control.

Replace the 12BY7 with a 4-1000A

Sorry but I cudn't resist.

Seriously, I would suspect the driver. I think it is a 12BY7 and they
can go soft. Find a NOS and give it a try.

From: vsense@usa.pipeline.com
Message-ID: <544e9b$heb@news2.h1.usa.pipeline.com>
Source record: 192487

I am getting started in amateur radio and I seem to recall seeing a book that evaluated and rated older equipment. Maybe it was a collection of stuff from QST? Anyway, I would like to use it as a guide in purchasing a used HF radio with which to begin. For example, I'd like to know the difference between a Kenwood 520 and a 530. Anybody know where I can find this publication? Thanks. KD6BMK

Juno.accmail via Juno.accmail@Juno.com

Taken from the Juno.accmail FAQ:

"Juno Online Services, L.P. is the largest and fastest
growing provider of free internet e-mail. The company began
offering its service to the public on April 29, 1996. They
spent millions of dollars on advertising in the Wall Street
Journal and the New York Times, and reportedly had 100,000
requests for the free software even before offering it to
the public. As of September 1, Juno had over 350,000 users."

[...]

The Juno.accmail Discussion List

"Juno.accmail@juno.com is a Juno account, set up by Brian
West <bkwest@juno.com> and currently maintained by Ed Bockelman
<edbock1@juno.com>. The list is used to forward discussions
concerning accessing the internet through Juno and related
topics. Currently all postings are sent out once a day in digest
format. Alan S. Harrell (ASHandRR@TGN.net) uses his internet
account to forward the digest to over 160 subscribers."

Subscribers may participate in discussions relating in any
manner to the Juno Online service; the Juno mail reader and
interface; and general Internet e-mail access problems and
solutions. The Juno.accmail list was an off-shoot of the larger
Listserv list, ACCMAIL, which discusses Internet access via
e-mail. The Juno.accmail list was created due to the demand
from ACCMAIL Juno subscribers for more specific discussions
aimed at their particular e-mail software.

If you would like to join the Juno.accmail discussion list,
or receive the latest edition of the FAQ, send a message to:

Have recently had an Azden PCS-4000 donated to
school club in non working condition.

Does anyone know anything about this radio? The
Ham donating it said the PLL was unlocked and the
radio had a history of doing that. It had been
repaired a couple of times. He is looking for
papers for details.

In the meantime, we have the manual but no
schematic. If anyone has a schematic, the usual -
will pay for copy and postage or fax charges

thanks

Hams who have surplus UHF equipment:
Please consider helping victims of civilian electromagnetic
weapons testing. We want to build a demonstration
device to show public officials that this type of
weapon exists right now, and is not some sort of
futuristic "pie in the sky".

The years of electromagnetic harassment have left
most of us nearly destitute. Donation of possibly
usable UHF transmitters would be a big help.

We have signal specifications. To view those specs
and for further information, please visit:

http://www.netaccess.on.ca/~raven1

Thanks for taking time to read this.

870. Discontinued Alinco Radios - 600 Lot Below Cost!!

Newsgroup: rec.radio.amateur.equipment
Date: 1996-10-17 00:00:00 UTC
From: news@connect.mv.com
Message-ID: <DzFBJq.1x5@mv.mv.com>
Source record: 192500

Are you interested?

We have access to 600 Alinco Radios - older discontinued models. All are new and in working order. Some may not have the original box. There is a mix of 144mhz Handheld, 440mhz Handheld, 144mhz mobile, and 144/440mhz mobile. A complete inventory list will be available shortly. These units are NOT covered by a manufacturer warranty. Each unit will have one line etched through the serial number. Asking price for the lot is US$60,000.00

If you would like further information please inquire directly. Time is of the essence. The inventory must be liquidated by the first week of November.

Date: 1996-10-17 00:00:00 UTC
From: n2cjj@ibm.net
Message-ID: <545m1q$21i0$3@news-s01.ny.us.ibm.net>
Source record: 192503

I have found a source for those DC power cord plugs. The ones I've got have 6 pins, male plastic with metal female (barbed) inserts.

The plug fits most 12VDC HF radios:
Icom 720, 735, 706.. and alike, newer Yaesu models and Alinco DX70.
Kenwood-TS120, 130, 140..430, 440, 450..850,..TS50,60, 660, 670...and alike.

Make your own power cord yourself, YOUR WAY!
Crimp or solder, long or short, heavy gauge wire, purple with polka-dots...

I'm offering the 6 position plug with 6 inserts for $4 each,
or a deal 3 for $10. All prices include postage in the US.

To order, kindly send a check to:

R. Langston
286 Hudson Street
Cornwall-on-Hudson, N.Y. 12520

You can also email me for info at: n2cjj@ibm.net

It's a great deal if you use one rig at home, in the car and at work and
are stuck dragging one power cord all over....

I still can't believe AES, HRO and others get $30 for a power cord.

880. m□□Mods for ICOM IC-T7a?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-10-17 00:00:00 UTC
From: reykowsk@ee.tamu.edu
Message-ID: <5461lf$n68@news.tamu.edu>
Source record: 192510

Hi there,
I recently bought an ICOM IC-T7a which I am planning to take
with me to Europe.
I am therefore interested in modifying the radio to European
ham band use.
Is there anybody out there that can give me some hints on how to do this?
Other mods are welcome too, off course.

Thanks in advance,

881. WANT: Pro-46 Manual...

Newsgroup: rec.radio.amateur.equipment
Date: 1996-10-17 00:00:00 UTC

882. Willing to loan/donate 70cm xmtr?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-10-17 00:00:00 UTC
From: raven1 <raven1@netaccess.on.ca>
Message-ID: <545j9j$npn@news.bellglobal.com>
Source record: 192512

Hams who may have surplus UHF transmitters,
please consider loaning or donating a
working or near-working xmtr to assist
victims of electronic weapons testing.

We victims hope to set up a demonstrator
unit which will show public officials that
the technology for RF weaponry is not
futuristic "pie-in-the-sky" but has already
been developed and is in continuous use
on innocent civilians in the U.S., Canada,
and other countries.

We have signal specs, and would need to
modulate the rig according to those specs.
Please visit the following site for more
information:

http://www.netaccess.on.ca/~raven1

This forward-looking act of service to
people in distress would be in the highest
traditions of the amateur radio service.

Thanks to all who take time to read this.

Source record: 192516

Hello,
I have a Yaesu FT-767 with all three modules installed. It also has the tone board installed. Radio is in good condition and works excellently. I want some new toys so this one has to go. I also have the Yaesu SP-767 speaker for it. I also have a Omni DX-88 vertical antenna for it if anyone is interested. I would prefer to sell the radio and modules together but I will consider offers on any of the items seperately. This rig is an excellent choice for HF as well as VHF/UHF all mode work. It does have the connections built in for packet and CAT control. If you wish to ask more questions please feel free to call me at Days: 320-632-8308 Evenings: 320-547-0092
Or you can E-Mail me at mikes@upstel.net
Thanks for reading this message and have a great day. DE N0RLF

Source record: 192518

Here I go again, First I want to thank all of those who responded to
my questions on who to buy from via mail-order, Thanks!!

Now I've narrowed it down to two HT units, the Alinco 582th, or the
Icom IC-W32A, "This replaced the W31A unit, only a few weeks ago.
Does anybody have any comments on these units???
I know I'm being picky but I want to but only once, and I really need
some input from you. If you can remember your first radio, and how
you chose it, I guess that's the way I am now.
Thanks "73" :)

The Habo Scoutgroup.

YES! Live! Here's the new modified Web page from the
Habo Scoutgroup, Sweden. Now with The Java applet
"InterHam" that connects our radio-transmitter to the
Internet. Just take a look at:
http://www.algonet.se/~jhe/jota.html
as of the 18-20 October, you will see the active
-LIVE- transmitting/receiving frequency from an IC-735
(ie a radio transmitter) operating in the Jamboree On
The Air 1996. Abt 50Km North of Stockholm. Just Tune
in your transceiver and give us a call.

n.b At some times there will be a [inactive] message,
just give it another try later.

All the best! Cu at the JOTA/I!

I'm looking at dual band mobile rigs. Have the folowing requirements
and/or preferences:

Small, easy in and out between cars (I can't afford two radios)

Large display, prefer alpha-numeric (so I can name repeaters)

Good versatile remote control mic ...

Am looking seriously at the Yaesu FT-8000 and the FT-8500, I'd
appreciate any feedback or suggestions. I have a FT-50R and like it
very much (I especially like the computer progammability)

Thanks, Bob Good, AE4XG

1) Check the geometry of the plugs there, ...Do they fit any HF
Rigs..I don't think so...You probably fit square plugs.. in round
holes when you were in 5th grade, Too.
2)About $0.50 each there includes ...about...$3.00 UPS
shipping...you've got me there. Not quite $4.00.

I'll tell ya, I find a source for those blasted plugs that I'm being
thanked so much for at hamfests and ...everyone's an expert.
Why didn't you think of it Tom.

PS: how much does it cost you each month on aol...touchee'

and have a nice day. 73, Bob N2CJJ@ibm.net

904. Need some help: Want inexpensive 2M w/ SSB

Newsgroup: rec.radio.amateur.equipment
Date: 1996-10-18 00:00:00 UTC
From: gradyr@mindspring.com
Message-ID: <gradyr-ya023080001810960204040001@news.mindspring.com>
Source record: 192342

I've been looking into buying my first radio. I don't want to limit myself and allow for expansion as I get more into HAM (and more $$ in my pockets!). I think what I would really like to have is an inexpensive 2M radio with FM, SSB, and CW but the only ones that I can find are pushing close to 4 digits. Can one be had or built for under $400? I'm not looking for huge tx power or anything. Can someone advise me a little?

OR even better yet...anyone willing to be an "internet elmer"? My local club meets on Thursday nights and I have nightclass then. Would prefer someone in the South East as I might be able to visit sometime in person. Any takers?

TIA,
Grady

>them in a TS-830s and would appreciate any comments on this subject.

The 6146W is a military version of the 6146A or 6146, therefore it is not
a suitable substitute for a 6146B, in the case where a 6146B is
necessary and a 6146A is not sufficient.

Source record: 192345

I have recently purchased an Icom X2A
Unfortunalty, it is the "A" version, and is configured for the
USA standards. Changing the RF to 430 instead of 440 (rx from DC to
IR) was already done, but I still miss the 1750Hz tone to open
trepeaters over here...
The Icom X2E has this function at [PTT]+[400] but It's not on the X2A
Probably the two radios is the same one, with just some minor
modifications. Anybody know how to do this? it is probably the same
as the W2A (the X2A has 23cm instead of 2m) It would probably be
either a keycombination or moving some resistors/diodes around

I too have had my FT-50R for a while (45-50 days) and love it. Read the manual carefully should you buy it, as with most HTs today, programing and using the many functions can get confusing. I highly recommend the software/cable package (You MUST use the supplied cable). I have version 1.05 of the software and some of the mods detailed in FT50R web site won't work.
To sum it up VERY please with the Yaesu FT-50R!

I'll second this comment. The people at Texas towers can be very rude.

I've been there about 4 time (I'm a new HAM) and EVERY TIME they could care
less that I was there. On one of the trips I was able to get _some_ help.
Less than 2 min into the "help" the clerk said "I'll be back." He walked over
to what appeared to be one of his buddies. I hung around in the store for
about 20 more minutes. He never came back!!!!

As a result I bought my Kenwood HT-79A(H) some were else.
I'm now looking for a moble rig.

>Icom IC-W32A, "This replaced the W31A unit, only a few weeks ago.
>Does anybody have any comments on these units???

Well Stan, like everything else in life, these two rigs have their pros and cons. I'll start with the Alinco 582:

Pros: .. reasonable price ($309.95 at Radio Center)
.. LOUD audio, best of all HT's!
.. easy to operate and program, you hardly need the manual
.. the supplied wall-wart charger fits 7.2v and 12v batteries
.. good sensitivity within ham bands, also good on extended VHF.

Cons: .. display is a bit hard to read, especially symbols for offset and tones. Sometimes must tilt rig at an angle to get good view. The backlit keypad isn't all that great either.
.. poor sensitivity in airband and on UHF above 450 MHz.

And now for the Icom W32A, which BTW, I've only owned for a few weeks and am still learning about it.

Pros: ....great receiver, sensitivity is great in airband, extended VHF, extended UHF, everywhere.
.... a fantastic automatic squelch feature. Just set it and forget it.
.... best display I've ever seen on an HT, backlighting is great.
.... operating buttons are labelled well and spaced far enough apart.
.... audio quality is decent, though not as loud as the 582.
..... lots of techie features like battery votls display, and you can enter alphanumeric names for each memory channel.
U/V, U/U, V/V, and V/U display configurations.

Cons: .... the biggest rub, the only way to charge the battery is to plug the supplied wall-wart into the radio with the battery connected. So even if you have a spare battery, you can't use the radio and charge a battery simultaneously.
Of course Icom's fix for that is their $90 drop-in rapid charger.

Despite my gripe about battery charging, I prefer the W32 over the 582. Remember the W32 is a bit pricey, I paid $399.95, but that includes the 9.6v battery for 5 watt output. The W32 is basically a W31 with some operational improvements. Hope this info helps,

Date: 1996-10-18 00:00:00 UTC
From: killian@aztec.asu.edu
Message-ID: <5487ms$gv8@news.asu.edu>
Source record: 192353

Hi all,

I have a couple of FT-11's with VOX headsets (I think they are VC-22's). Anyway, when using them there is absolutly no feedback in the earpiece to let you know that the mic is keyed. If the gain is too high and outside noise is keying it, or if you are hiking and breathing heavy, you can't tell that it is keyed.

My kids have a pair of Radio Shack FM VOX headsets that feed a little of your own audio back in the earpiece when the mic is keyed, much like a telephone. They work GREAT!

Does anyone know of a mod that can be made to the Yaesu headset to do the same? I would settle for anything, audio, a click, a hum, etc...

Thanks

Mike Killian KC7JGC

I have to agree with Gary. Generally, I'll patronize local merchants before going mail-order. I can't tell you how nice it is to be able to hold, look at, and use a radio before making that purchase. Plus you're putting money into your local economy, rather than sending it out of state. Gary, Ron, and all the other people at HRO in Phoenix have put up with my endless questions, let me pull merchandise out of boxes, read manuals, and offered good advice. Those things are worth the paltry extra amount that you might save going mail-order. Especially when you are making a major purchase that you may own for several years. And in many cases HRO's prices are actually lower even when you have to pay sales tax when compared to mail order. I called about a dozen places when I was considering purchasing an FT-51R. The local HRO actually had one of the lowest prices even with sales tax. I didn't have to pay shipping and handling. I had the radio the same day. And I didn't have to worry about some nameless, faceless person 1800 miles away shipping me a DOA radio (that they knew was DOA) that I'd have to return at my expense to the factory and wait 4 weeks for a new one. (Stuff like that has happened to me when using mail-order).

You might also want to check your local tax laws. Many states require that you pay a use tax on items purchased mail-order from out-of-state. The company I work for was audited a few years back and we got nailed for not paying use tax on some mail-ordered office supplies!

Butch et al,

That's EXACTLY why I've been pushing for full no-code (including HF) ham licensing and for changes in the rules that will allow us to adopt more modern technology. We need both the raw numbers and also the increased numbers of tecnical professionals that such modernization would bring.

We have stagnated at about the 1950s/1960s level in the basic technologies that we are using commonly (SSB ... Morse code is from the early 1800s).

Where hams used to be the inventors, developers and early adoptors of new technology, we're now clinging to the past in great numbers chanting "CW forever" ...

RThat's NOT going to cut it when our bands become targets of commercial interests ... (HF WILL be targeted too in the next 20 years)

We're simply NOT living up to our obligations under Part 97.1 (purpose and goals for the amateur radio service) ... too many hams today feel (eronoeously) that "It's JUST a hobby!" ... no, it's a service, and if we don't start being worth (in public interest value) what our bands are

worth (in dollars) we'll lose our bands in the next 20 years for sure
..

For more, followup to rec.radio.amateur.policy ...

Hello,
Yaesu ft-767 with the 2m, 6m and 440 MHZ modules. The rig also has the tone board installed. Rig is in good shape and works excellent.
I also have a DX-88 8 Band vertical antenna for it. This antenna does 10-80. The Yaesu SP-767 matching speaker is also included. I am asking 1800 for the whole setup. I will consider seperating the modules but prefer to sell the whole setup as a unit. Thanks Mike.

I have just purchased a IC-281H and would like to expand the receive

coverage in the uhf and Vhf bands.

Would someone be willing to spill the beans on this Radio?

I have not been able to find any mods in QRZ or ect for this rig.

With driving over 800 miles a week I need all the entertainment I can find

to keep me awake.

If someone has skematic diagram for this critter I think I could find

my way threw the forest.

Thanks a bunch for interest in helping

Jack Kovar

941. Tucker is gone!

Newsgroup: rec.radio.amateur.equipment
Date: 1996-10-18 00:00:00 UTC
From: "Jim Gerke, KC5OA" <jgerke@why.net>
Message-ID: <32686CF5.6227@why.net>
Source record: 192429

FYI -

I just learned that Tucker Electronics has pulled out of the amateur radio business. Calls to their local number here in the Dallas area receive a recording saying their ham operation has been sold to HRO but that they will remain in the test equipment business. I finally was able to talk with a receptionist who told me that as far as she knew, HRO was not going open a store in Dallas -- they just bought Tucker's ham radio assets.

Robert F. Good (bnb@mindspring.com) wrote:

: Am looking seriously at the Yaesu FT-8000 and the FT-8500, I'd
: appreciate any feedback or suggestions. I have a FT-50R and like it
: very much (I especially like the computer progammability)

I have an FT-8500. No other experience with mobiles. Intermod resistance is good (not perfect). The gonzo potato-head microphone is very useful, but there is a bit of a learning curve price to pay and it can be tricky to use at times. It's not for everyone, but generally I'm pleased with it and find it an advantage (I do think the joystick is somewhat of a gimmick, though, and I think I would prefer two rotary dials at right angles with a push button).

The FT-8000 is more traditional with some added features and some that were dropped from the 8500. I've never used one.

Have fun...

I have the original, the R-4, Bob. As I recall, the major improvement in the R-4A was a solid-state VFO. After that, I believe more and more stages went to transistors, through the "C" model.

You may want to post this question on the *new* rec.radio.amateur.boatanchors newsgroup; the "4" lines qualifies as such.

>>When I get my license what radio should I get?

What is Ham Radio, and How do I get started?
- A short introduction by Hans Brakob, K0HB

Here on HamNet we frequently see messages asking for more information about the hobby, and how to get started. This file is a VERY brief attempt to explain the hobby and give some pointers on where to get more information. Almost certainly I won't answer all your questions, so feel free to ask for help on the forum. Hams are famous for their eagerness to help newcomers.

(First I have to explain something you might not have realized. In doing so, I'm going to paraphrase something written by Steve Ford, WB8IMY, in his introduction to a book entitled "The ARRL Operating Manual". Steve, by the way is a regular here on Hamnet. He acts as the ARRL HQ representative.)

In case you didn't know, belief in magic is a necessary requirement for all Amateur Radio operators. Of course, you won't see a question concerning magic or metaphysics on the test you take to obtain your license, but in your heart you will come to believe in that powerful, intangible force.

All of us in the hobby have felt its influence at one time or another. Some night when the band is dead as a doornail you'll be tuning aimlessly, not expecting to hear a single signal because NOTHING could be coming through at that hour. But then, rising out of the noise like a ghost, there will be a faint call from another stalwart explorer thousands of miles distant. You pounce, establish contact and both of you marvel at the fact that the conversation is taking place at all. A few minutes later, however, the signal vanishes as quickly as it came. Your rational mind will shrug it off as a quirk of propagation, but that little tingle in your gut will tell you otherwise.

If you could travel back in time to, say, 1294 AD, you'd probably be burned at the nearest stake for even suggesting that two human beings could communicate with each other over great distances without a physical connection. No doubt they would accuse you of dabbling in magic -- and they'd be right!

As Amateur Radio operators, we work feats of magic every day. Many of us have become jaded about our powers and we tend to dismiss them as commonplace. We hardly think twice when we use our equipment to summon the elemental forces of the universe. But every so often we

need to pause and remind ourselves of what we are really doing. We need to remember the essence of what drew us to our unusual avocation in the first place: the wonderful magic of wireless communications.

So how can YOU become a magician?

First, you need to prepare to obtain a Magicians License. The Federal Communications Commission calls them Amateur Radio Operator Licenses, and they come in 5 "classes".

There are two "entry class" licenses, namely the Novice and Technician class. These two classes of license are designed to give the newcomer access to a number of frequency bands without a too-strenuous exam.

The Novice class gives the widest range of frequencies, and will be attractive to folks with a desire to talk to "distant" places. The written test is the simplest of all the tests, and the examination also requires you to be able to copy Morse code at 5 words per minute. This license will also give you access to some "local" bands, but not as many as the Technician class.

The Technician class license, as the name implies, is aimed more at folks with a technical bent (you don't have to be an electrical engineer though). The written test is a bit more difficult, but you don't need to know Morse code for this license. The frequency bands for this license give you more "local" communications, although if you wish, you CAN take the Morse test, in which case you will also get access to the "worldwide" bands the same as the Novice class.

The next three classes of license are General, Advanced, and Extra. These three classes have access to portions of all amateur bands, with progressively more difficult exams, and requirements for copying faster Morse code (13, 13, and 20 words per minute respectively).

To prepare for the exams you will need some study material and more information about classes, examination points (the exams are given by volunteer Hams in your community), and clubs in your area. A number of organizations will be more than willing to help. One such organization is the American Radio Relay League. Write them at:

ARRL, 225 Main Street, Newington, CT 06111

or call them at 1-800-32NEWHAM.

Ask for their "newcomers" package. It will include more detailed information, a list of classes and clubs in your area, and a list of scheduled examinations in your area also.

(Continued to next message)

963. RE:what to get

(Continued from previous message)

If you are near a Radio Shack store, go there and ask for a book entitled "Now You're Talking". This book is also available from the ARRL. It contains all the information you need, including study material and sample questions for the examinations for Novice and Technician licenses.

Good luck, and welcome to the "magical" hobby.

968. This IS NOT the group for sale items

Newsgroup: rec.radio.amateur.equipment
Date: 1996-10-19 00:00:00 UTC
From: w8jitom@aol.com
Message-ID: <54ba25$i8d@newsbf02.news.aol.com>
Source record: 192377

Most of the traffic on this group is items for sale, even though the FAQ list specifically says this is not the place to post for sale items.

What's especially disgusting is the commercial people out to make a buck using a discussion group for advertising. Bad enough all the junk mail sent out, now we get newsgroup pollution.

I didn't realize that there was any restriction on offerings from
commercial enterprises, which in all actuality can be extended to
include a majority of the regular "horsetraders" on rec.radio, who
buy/sell as a way to support the hobby, supplement income, or both.
And besides, anyone offering NIB discontinued ham gear to the hobby at
a substantial savings is fine by me, I'm glad to have the chance to
get something that I wouldn't normally be able to afford.

The charter and FAQ for the newsgroups specifically states the proper place for sales is in groups set up for that purpose. There's no need to feel cheated by this, because it's easy to put the stuff in the right place.

This group is chartered for discussions about equipment, not as a swap or sale net.

It's especially in poor taste to post commercial ads here, the very concept is idiotic. Just imagine what a mess any newsgroup would be if EVERY company that had a pile of junk to sell posted an ad here.

That's why the legitimate and thoughtful merchants have web pages that they pay for and support, they don't tie up bandwidth on discussion groups or send people unwanted garbage. Thank goodness most people are smart and considerate enough to realize this.

I am currenly looking at the Icom-706 and the Alinco DX-70TH (there is also a DX-70T.... but this one does not transmit 100W on 6m rather 10W). I am actually leaning twards the Alinco for all their 'built in filters'. Neither of these radios facilitate notch filters, but both support IF shift. I have heard that the Iom-706 does not have real robust mobile-use noise reduction... could be just some isolated experiences though. the Icom does also support all-mode 2m which is cool, but I have 3 2m rigs alrady and most communications on the 2m (at least in my area) is via the FM repeaters. The Alinco has some very attractive pricing on it right now... about $899.00 for the DX-70TH model. The best thing is to visit an amateur radio dealer and 'test drive' one with your own fingers as both these rigs use menuing and they are intuitive for some and just downright hell for others to operate.

Good luck... remember that it is the thill of the chase, not the catch.

I believe this has been the subject of much debate.

You can mask a memory, basically deleting it, but when you go to store
another memory, the nice little "u" for unused will not be there.

Anyone have any ideas short of downloading the radio to the PC,
reseting it, and reloading the memories?

It's my understanding that Tucker's is closed and will not reopen under any name (HRO et al). HRO is moving all of Tucker's amateur assets to their existing locations. It's a shame indeed, however, I thought when I saw ALL the equipment that Tucker bought when he started, that the place wouldn't last. One example I remember specifically is the thousands of dollars tied up in antennas alone (huge beams, etc.), that ANY radio store probably doesn't sell more than 5-10 a year.

Sorry to read about your bad experience at HRO. Unfortunately, he isn't the only jerk in CO. Most of the people here that feel that way also migrated here from another state. Worse, their predjudice is mostly unwarranted.

I live north of Denver and I haven't been to the Denver store. After reading your posting, I'll know what to watch for. For what it's worth I moved here from CA in 1968 and no one ever said anything derogatory about my moving here.

Does anyone know where I can find the Kenwood TH22AT "beyond MARS" mod file? I have searched every ftp mod directory I can find and still can't find it. I know it exists, Kenwood has referenced it in their service bulletins.
Thanks in advance,

Don, KO2J

992. FT-530 Help with circuit component identification (anyone with a Technical Supplement??)

Newsgroup: rec.radio.amateur.equipment
Date: 1996-10-19 00:00:00 UTC
From: kc7mqj@cyberhighway.net
Message-ID: <32693b99.10405254@news.cyberhighway.net>
Source record: 192454
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.equipment,rec.radio.amateur

I am trying to locate component values for the components on my "V&V Local unit" (at least that is what my Technical supplement calls it).

I can't determine the values of the parts on this board!! I see the names but can't match them up to any parts list anywhere.

The parts are:

C 4003
C 4004
C 4016
C 4002
C 4005
C 4012
C 4014

L 4002
L 4003

Q 4001
Q 4003

R 4006
R 4001
R 4002
R 4005
R 4009
R 4004

If anyone knows what the values (and or industy, not Yaesu, part numbers) are for these items I would greatly appreciate it if you could forward them to me. It seems I must be missing a page of my Technical Supplement.

Thanks a bundle,

"If it ain't broke, it doesn't have enough features yet!"

And a 1 amp current draw, you can fry eggs with it. KPC-3 draw 20-40 mAmp.
And compared to the costs of Telephone modems these days, all 1200 baud
TNCs should cost $10.00

What do you want to do? HF is communicating over short or long to very long distances, many modes(CW, SSB, etc.) in which case you want the Tech Plus with code. If you like to get into VHF/UHF, don't bother with code, get the Tech license.
I am like HF operation. I lke the idea of morse code communication, I like the chance to talk to people all over the world, as well as locally with a self-contained unit, ie. no repeaters, etc. You may be turned on by HTs and all the local activity, or fast packet radio, or many other possibilities. Your best bet is to get into some clubs, or friends, and see what they do, get a Tech Plus and operate HF, VHF/UHF, then buy a rig or rigs that fit your interests. E-mail me if you decide to go HF, I would love to have somebody else to do CW with. As to what radio, I love my Yaesu FT 900 AT, but there are a lot of really good new and used units out there. Asking this newsgroup for experiences is a good place to start, the decision is ultimately yours as to which of the good units feels and runs best for you.

1006. Help with conversion of Land-Mobile radios

Newsgroup: rec.radio.amateur.equipment
Date: 1996-10-19 00:00:00 UTC
From: tjohnsto@erols.com
Message-ID: <54ar7d$dgn@boursy.news.erols.com>
Source record: 192468

I am looking for information regarding the conversion of a Motorola
Land Mobile (Motorola Trunked System) radio for amateur use.
Does anyone know if it is possible, or not? Are schematics or service
manuals available? Anyone else tried this before?

Motorola MOSTAR Radio
Motorola Model#: D35TLA5G00CK
Serial#:603HJQ1434 dated 7-31-84
apparently changed to 6039999859 dated 7-8-86

additional numbers found on interior of unit:
FO#: 031101270303701

Frequencies listed on interior cover:
865.9375 MHz, 864.9375 MHz, 863.9375 MHz, 862.9375 MHz
apparently SAT encoded at 105.9 Hz

There is a 16 channel knob with the first 2 active. There is no
speaker, unless the microphone also doubles as a speaker, but appears
to be a mounting location for one, behind the front panel. A D-sub 15
pin female connector is mounted on the rear heatsink, along with power
and antenna.

From: Edward <edward@nym.alias.net>
Message-ID: <199610202032.QAA01716@anon.lcs.mit.edu>
Source record: 192275

I have tried to make the mods that were suggested on one of the web sites (http://members.gnn.com/hca/ft50/index.html) to a new ft-50r using the software package that I ordered with the radio. Although some of the mods seem to work fine (like expanding the frequency range over which it will transmit), the mod to expand the receive frequency range from 76 to 999 MHz does not seem to work. I pull the plug, as instructed, but I can not get the unit to work on any but the advertised frequencies. Does anyone know what is going wrong, or how I can reprogram the unit. I suspect the newer software is different. Maybe there is a source for the older software, or a new software package is available for just this purpose??

Guess that might be a fair criticism for those who HAVE a local store.
But most of us don't. That's why the mail order business is big.
Nearest "local" store for me is 100+ miles away. And it's an HRO
outlet in Atlanta. And I think it is the ONLY ham store in that city.
Pickings are slim out here in fly-over country.

Anyone out there know of any mods for the Drake TR-4? Would be interested in swapping ideas and information regarding them. I currently have 2 complete 4's with the AC and DC p.s. and matching VFO's and a pair of MN-4's. If it doesn't glow in the dark it's not real radio.

Denver HRO rude? Not to me...

I've dealt with HRO in Denver twice, and on both occasions found them to be very courteous (can't speak for thrifty, brave, clean, or reverent...) I dealt with Joe (store manager?) each time. He was helpful, made suggestions that benefited both parties, and took ample time to explain the store's policies.

What more could you ask?

The firmware inside the radio has been changed so that pulling the plug
will not toggle the radio into a European mode. This change was made in
radios with the 3rd and 4th digits of the serial number greater the 05.

Hallo dear friends!

I have a problem with my TS140S. If it is not used for about 1 or 2 weeks, and I turn it on, the display is dark or showing nonsense and the transceiver is not to be influenced by the keys.. If I wait some minutes, it works suddenly 100%. If I use it the next day, it runs OK. The difficulties are only there, if the TS140S is not used for some days.
The CMOS battery is OK, RESET doesnï¿½t help, because it doesnï¿½t react on pressing the keys.

Can you help me?????

my e-mail: WSterta@t-online.de

>Thanks for your time,

>Tom, KE4GSK
>Tom Stiles

TOM, I own a TM-701A and it will recieve all the frequecies you want,
right out of the box. It sounds like you have set the Programmable VFO
tuning Limits as descibed on page 16 of the instruction manual. You
can clear the VFO programming by following the VFO reset procedure on
page 10. Press and hold the VFO key while turning on the power. The
VFO will be cleared without touching other memories.

Give it a try and good luck.

BTW, your 701 is getting old enough to have the lithium memory
battery replaced soon. I just had mine done. When it goes below 2.8
volts, random mis-operations result.

A trip to my home page reveals there are many good files and programs for
amateur radio operators that want to use Mac computers.

<http://www.mv.com/ipusers/wd1v/>

* Ham Radio Test Simulators - where you can go from Novice to Extra Class
practicing the actual tests right on your Mac! Check out the info on the
new NO CODE license or scramble your neurons and learn Morse on the Mac
too!

* Macnet Roster - a virtual "Who's Who" HyperCard stack with more than 750
entries giving the names, addresses, phone numbers, of radio operators
all over the world that are using Macs. Check out their projects and
their passions and put a design on your Mac Radio future when you see
what neat things are being done!

* Mac Ham Radio Software Listing - as the name implies, its "The List" of
the latest - much of it with FTP links so what you see is what you can
get with just a click.

* Ham Radio.FAQ - compiled on a Mac with a lot of links to great Mac FTP
sites for radio, electronic engineering, and similar data.

: >my goal is to get on the air for $60us. i hope i can build a real
: >nice rig like Corporal Carter's on Hogan's Heroes.

: Ah.... Sergeant Kinchloe was the radio guy. Carter was the bomb guy. :-)

: Good luck. I enjoy building things when I have time, but unfortunately
: it's RARE that I have much time for building nowadays.
: Sixty dollars is a shade low for a budget (a good receiver is the trick),
: but it's not impossible.

Well..... Let me think about this a minute. Tech Plus.....
hmmmmmm..... If I recall properly this gives you HF Novice CW bands and
a bit of 10 meter phone.....

For limited 10 meter phone you might think about a converted single
sideband CB set. One sees these at hamfests for reasonable prices. If
you are handy in electronics you could probably find one at a garage sale.
Converted CB sets are a bit limiting though, and are sometimes tricky to
put on an allowed frequency.

A better choice would be one of the older 5 band tube type transceivers.
Something along the lines of the Heath HW 100, 101 line. Simple, sturdy
and adequate. These are often found at hamfests for something around
$100 - $150 (frequently cheaper late in the afternoon). There are others
(the Drake TR series, Hallicrafters, Galaxy and many more) which offer
much the same features. Do a bit of research, ask some of the older hams
in the local club (you do belong, don't you?), take in a local hamfest to
see for yourself the things which are available and then make your decision.

Another avenue to explore is the world of QRP (very low power
operation). There are fairly low priced kits available which will
provide hours (days, weeks, months) of building experience and which will
give you many years of operating enjoyment.

Be forewarned however. Your likes and preferences will change with time
as will your requirement(s) for equipment. (Can you say second job, just
for toys?)

Welcome to the hobby and world of amateur radio. May it give you the many years of friendship and enjoyment that it has given me.

Marty

I am looking for an antenna multicoupler. Prefer TMC
but any working unit will do. Prefere 6 or more outputs.

I also need a manual for a Jerrold 900B sweep generator.
A good copy will do.

Will buy or trade.

Thanks gpewitt@execpc.com

I replaced my IC-761 with a FT-1000MP this summer. I too operate mostly CW.
I surveyed this group and received many responses, with the overwhelming
majority
being very favorable.

I really like my MP! The RX blows away any other radio I have used, and the
qsk works great.

The Drake R4 and R4-B are essentially the same, with the R4-B having a few solid
state components in it. Both have variable and shiftable 50 KC IF's. The R4-B drifts
a little less on startup due to less tube heat. The R4-C uses selectable crystal filters
in the IF. Performance is virtually the same in all three as they all use the same front
ends. They all use a variable inductor VFO, 25 KC per dial rev, 1 KC markings, discernable freq readout to less than 200 Hz. Frequency drift on my R4-B is less than
700 HZ cold to full warm. After warmup, it never drifts more than 20 - 25 HZ.

In a nut shell, if you want shiftable IF, go with a R4-B. If you want the better skirts
of a crystal filter, go with the R4-C.

About the finest transceiver I've owned in many ways. Great filter choices, superb DSP in the front end, not the audio output! Fast and rugged tuner. Noise blankers that actually work! An adjustable notch that is THE best in any transceiver today. Two separate receivers run simultaneously. Greatest DX and contest working rig I've seen. Myriad of controls on front panel and then a huge menu system (which takes some getting used to using. This is one radio you do NOT want to lose the manual for! HI!)

Receiver is better than TS950SD or IC785, a notch below the new JRC transceiver however on receive. Superior to all the TenTecs (I had the Omni VI and Paragon) except for phase noise.

Direct frequency entry is fast and DSP options use two knobs to the right of the secondary receiver VFO knob and are almost intuitive. GREAT qrm and qrn reducers. I am in a harbor with lots of RF flying around and this rig just quiets everything out. My other transceivers are overwhelmed.

Two antenna inputs in back, great for hooking up a super listening antenna like a beverage to the B and your primary transmitting antenna to the A input, then you can switch back and forth instantly to pull out the faint station when he transmits.

Great buy and a LOT of radio for under $3000. Get the MD-100 desk microphone without doubt as well. Gud Luck and 73, <N1FSK, Steve>

1065. Want info on MFJ-9420 20M SSB XCVR

Newsgroup: rec.radio.amateur.equipment
Date: 1996-10-21 00:00:00 UTC
From: dvhunt@es.com
Message-ID: <54ge7v$9mf@escc.corp.es.com>
Source record: 192227
Cross-posted to: rec.radio.swap,rec.radio.amateur.equipment

I recently noticed an ad for the "MFJ-9420" 20 meter SSB transciever for $219. It piqued my interest. Sure, it only transmits and receives on 20M with SSB, but it's simplicity attracts me. It might make a great second rig.

Anybody have any more info on it? Anybody got one that likes it or dislikes it?

Anybody got one for sale used? Any information on it would be greatly appreciated.

Thanks.

1066. Mute problem with Kenwood TS-700SP

Newsgroup: rec.radio.amateur.equipment
Date: 1996-10-21 00:00:00 UTC
From: gremlin@iaccess.com.au
Message-ID: <54fns3$4v1@sleipnir.iaccess.com.au>
Source record: 192228

I have owned this Kenwood TS-700SP multi mode two metre band transceiver since new in 1980. In the last year or so the mute will not activate unless I turn the R.F. gain down. This problem last for about an hour or two, and I beleive is probably temperature dependent. After the set has warmed it operates normally and the R.F. gain can be returned to max.

Help needed.

1/ If anyone has experienced similar I would appreciate a comment and possible repair suggestions.

2/ If anyone could help me out with the schematic of the TS-700 transceiver.

Regards ham in need

Peter (VK3YSF Melbourne Australia)

If I recall, the expanded receive function of the ft-50 is covered in the
owner's manual. I "think" that expanded RX is hold down LAMP, PTT and then
power up the FT-50. Then after powering up, pressing the knob down several
times should show the different bands, 144, 222, 300, 430, 800. The 'normal' RX
would only show 2 bands 144, 430.
(I may be wrong on the buttons to hold down. The correct buttons should be in
the manual so look there first.)

There was also the R4-A. It had the solid state LMO like the R4-B. I don't
recall if the R4-A was triple or double conversion. I think it was just a
double conversion with the R4-B a triple conversion. The R4-A had the
selectable skirt IF filter with descrete components.

Hiyall,

: >> Could you enlighten me about the essential differences between the
: >> Drake R-4, 4B and 4C? Tnx, Bob

For Drake-lovers, Wayne Montague, VE3EFJ, has performed a valuable service in compiling what is so far probably the best single source of obscure and useful Drake information around. It's a public doc, and Drakeful folks do pass it around, but it's also available both on the Compu$erve ham forum and through the boatanchors mailing list listproc. I could post it here (it's a biggun) if anybody's interested.

Regarding 4-line differences, there really aren't any BIG differences until the C-line. I've got examples of each R-4/A/B/C, all in good, working condition, and in side-by-side listening comparisons the differences are pretty minimal between the pre-C variations. The R-4 maybe has a bit less gain, the R-4B is possibly a little more stable, but any of the 4's seem to work just fine. All of them are transceive-compatible with all the 4-line transmitters, too. (There are more and bigger differences between the even earlier 2A/B/C receivers, than there are between the 4s.)

There are some variations in tube and transistor complement, but the underlying double-conversion architecture is the same throughout: 1st IF is at 5645 kc and passes through a 4-pole xtal-lattice roofing filter before downconverting to a last 50 kc IF where tunable LC filtering is used to set the final selectivity of the rx and provide PBT. Even the non-ba SPR-4 uses much the same arrangement, and as a result, if equipped with the optional interface, can also transceive with all the 4-line transmitters. (The SWBC-oriented SW-4/A has a 455 kc final IF.)

The R-4C is also somewhat the same, in having the same 1st and last IF freqs, and consequently also the same PTO and xtal freqs, making it also transceive-compatible with the others. The big difference in the C is the use of xtal-lattice filters as the main selectivity determining elements, instead of the LC networks used in the earlier gear. It is as a result somewhat more selective than the others, and this is still its main attraction, though there are plenty of SWL folks that prefer the earlier receivers for their superior AM audio.

In order to provide passband tuning, though, Drake converted the 1st IF up to a new 5695 kc 2nd IF by mixing it with the [variable] BFO, passing it through the new filters, and then converting it back down to the same old 50 kc final IF. In the older receivers, the LC nets themselves were tuned across the signal; in the R-4C, by changing

the BFO freq, the signals were moved across the [fixed] passband of the filters. Pretty slick, and it technically makes the R-4C triple-conversion.

Drake also threw in some convenience bits like 3-speed AGC, extra band-xtal positions and an easier-to-read dial, but it's a lot more like the older gear than you might imagine, and in a couple of details, actually a step backwards: the xtal calibrator and noise-blanker became extra-cost options, much like the [optional] xtal filters, whereas pre-C they were already there.

I like'm all.

Well, I "cut the green wire" and, sure enough, I have am receive.
But I still need tx on 155.160. It appears this will be "new"
info for the net- it is not available on (in?) Oakland or (qrp? I
wrote it down, checked it, had no luck, and forgot it!). In any case-
this is a pseudo legal request (no, it's not type accepted, but I
only use it for emergency (search and rescue) communication) and the
radio is only sortof useful without it.

Does anyone out there know how to open up tx on a Yaesu FT2200?
I'll even scan the schematics if you're that good!

The above comment isn't very helpful and I hope that when that person requests help, that they get the same kind of help that they just offered.

I would hope that if this person spent enough time to read the message and reply, that they would at least offer 'something'. Sorry to say that they haven't.

I have a Radio Shack HTX-212 and there is no modification other than MARS/CAP (which is in the manual also), but I have yet to find a frequency with voice communications that were outside of the amateur bands that I would even both worrying about getting a transmission in the air to the 'other' receiver. My suggestion, keep from the temptation (also loss of warranty) of messing with the insides of the transceiver. These little SMCs (surface mount components) are easy to damage if the 'screwdriver' or other object slips when making that 'important mod'.

By the way, what is the wonderful radio that is sssooo much superior than the Radio Shack HTX-242 that the above mentioned?

Don't know... seems as though he may not be so proud if his equipment, that he plump forgot to tell us what it was.

I bought my HTX-212 about a year ago and requested another 4 years of warranty be added at $8.00/year.... what kind of service did his manufacturer offer?

Dave KB9OPQ

I suppose that I'll read somewhere along in this group that the above does not apply as I am only a 'No-Code Technician'. Well, so be it.

Hi Chuck,

But in fairness we should also point out that the ONLY thing that makes a newsgroup a valid concept is keeping the data withing that group inside the guidelines.

Again, consider how chotic any group would be if even a small percentage of the subscribers used the group incorrectly. For example, AES, HRO, Radio Shack, MCM, Newark, Mouser, Digi-Key, and MFJ all have catalogs, and 90% of the people on newsgroups in the world have something to sell.

The only thing that keeps them from using discussion newsgroups to incorrectly post "for sale" items is common sense, responsible behavior, and peer pressure.

Thank goodness most people and businesses are responsable, or internet would be useless.

But if some third party comments that ALINCO is having a great sale, then
that is alright? This is an underhanded question.
And, Yes I have been listing stuff for sale, because my examination of
the postings clearly indicated that, that was the thing to do.
CHARTER? What charter? Yes, it should be posted.

Hmmm... I was in Denver about four weeks ago and I stopped in to see the HRO store (I had bought things from them by mail before). The salesman who greeted my HAS a "5" call himself, with a little cast aluminum plate on the sales counter. He seemed pleased to meet another "5er", and he was very nice to me (so were the other two or three guys I chatted with while I was there). Incidentally, I never once mentioned that I'd spent thousands of dollars with them (which might conceivably make someone be artificially nice to a customer). These guys are ALWAYS friendly.

It's true that Colorado natives don't like Texans much, but NO ONE was ever rude to me the entire time I was in Colorado. I had on my North Texas Mustang Club jacket, and a lot of people asked if I was from D/FW area, but NO ONE was rude. Especially the HRO guys!

I agree with your point, but was only showing a "lighter side" to the
issue. Another problem might be that I have been reading this group
for some time now and have not come across a charter or anything else
that shows the "rules". I know that ignorance is no excuse, but most
people probably don't know where to get the charter, myself included.
If it was posted on a regular basis, maybe people would know the rules
and follow them. You also have to understand that a lot of people do
not even know that Newsgroups even *have* charters and that there are
rules to follow. Posting it once a week might help out.

>>>The charter and FAQ for the newsgroups specifically states the proper
>>>place for sales is in groups set up for that purpose. There's no need to
>>>feel cheated by this, because it's easy to put the stuff in the right
>>>place.

By looking at the content of the rest of the threads here, I simply followed the leads put in front of me. It appears that 25% of the message headers contain FS:.

>>>
>>>It's especially in poor taste to post commercial ads here, the very

When did I, if ever represent myself as a commercial entity.

>>>That's why the legitimate and thoughtful merchants have web pages that
>>>they pay for and support, they don't tie up bandwidth on discussion groups
>>>or send people unwanted garbage. Thank goodness most people are smart and

They don't??? Wow, you must be on a different Internet than what I am on. The commercialization of the Internet started over a year ago, and while I am not representing myself as something I am not (A commercial Ham equipment dealer) there are plenty of people that post on this newsgroup as agents of major commercial equipment suppliers.

If you don't like the commercialization of the Internet, well, don't use netscape, microsoft explorer, or any other mainstream Internet software. They all profit from such tactics as mentioned above. You can also boycott every company that is a financial backer of large ISP's who use mass mailings and 'subversive' tactics to get business.

It has surrounded you, either put up with it and don't be a hypocrite, or reformat your HD.

I find it hard to believe that any employee was rude to you at the Phoenix HRO store. I've been going there for over 10 years without a single bad experience. I visit the San Diego store when I'm in CA, and can say the same for that location. HRO Phoenix has done a lot for the local ham community in donations of material, guest speakers, and time. I have on occasion seen the HRO employees give a customer a good ribbing, but only in fun. Some people may take that the wrong way, I guess.

As for people not liking expatriate Californians fleeing to Arizona, Colorado, etc.; can you blame us? The LA types are moving into Phoenix and bringing their anti-gun, anti-hunting, crystal channeling, we want more government ways with them. Plus the gangs are coming here from LA, too. I really don't want Phoenix to turn into another LA, but that is what's happening.

OTOH, I've been treated rather rudely by Californians when they find out I'm a 'Zonie, so it's a 2-way street.

The Ham scene in Phoenix is wonderful. Open repeaters, open autopatches. ARA dues 18 dollars a year. Go to Southern California, find a repeater with an open autopatch. Find a repeater that you aren't run off of for not being a 70+ dollar a year member, even though you're just visiting. The only exception I've found is San Diego. Nice packet community. Usually friendly repeater lizards, no open autopatches though.

>
>But I don't hate them back. I like visiting Phoenix and Denver and will

Heck next time your in town please drop in on one of the local ham club meetings. HRO usually has a schedule. The ThunderBird ARC meets the 3rd Thursday of every month at the APS building. 23rd Ave. &

Peoria. 7:00 PM. We usually have a good program. Last week we had a great guest speaker come in and talk about his recent DXpedition to Miday Island! Awesome slides and presentation. Really, we're nice people. BTW, I was up at the Grand Canyon last week before the Parks Service closed the North Rim. The Grand Canyon has both a 2 meter and 70 cm repeater. So don't forget your rig when you come to visit Arizona.

The ARA has 19 repeaters in central Arizona with 5 OPEN autopatches, including one linked to Mt. Ord, near Strawberry. Hunters, campers, and hikers should really appreciate the fact that they can access an autopatch in Phoenix from most of the Mogollon Rim. I'm told that another link will run to Mt. Eldon in Flagstaff in the near future. The ARA as well as most other clubs in Arizona keep all their repeaters open for use, especially for out-of-state visitors.

Hi, Jim, ling time no see!

I've heard a JUICY rumour that HRO is considering opening new stores in
the next couple of years, and Dallas is one of the locations that they
may be considering. THIS IS ONLY A RUMOUR at this time... but it would
be nice if they did!

I use 2 shortwave sets. A 1988 Realistic DX440 & a 1944 British Military R107. The DX440 covers 150kHz to 30MHz, the R107 1150kHz to 17MHz. The main use the DX440 gets is tuning to the oscillator of whichever domestic valve set I happen to be aligning.

The "Dirty Sand" set produces far more internal noise than the valve set. If I want to listen to a shortwave station I'll choose the 1944 set before the 1988 set every time.

No one was flaming them, any more than it is flaming if someone points out
driving down the wrong side of a road is dangerous and that part of using
a car is learmning the rules.

If everyone with something for sale on a one shot basis used this
newsgroup even once as a media for free advertisments, it would be useless
for anything else.

I do think posting the FAQ list is an excellent idea, a copy should
automatically be sent to anyone accessing this group. That was a great
idea.

1103. Kenwood repair cost?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-10-21 00:00:00 UTC
From: mcovingt@ai.uga.edu
Message-ID: <54eh66$s7d@hobbes.cc.uga.edu>
Source record: 192300

In general terms, how much does Kenwood charge for repairing a radio?
My TM-731A is in need of some work (a new backup battery, among other
things -- it's soldered in and hard to get at). Normally I do my own
repairs, but this is a highly miniaturized piece of equipment and I'm
wondering if I should send it to them.

From: Charles J. Michaels, W7XC
Ex W3IGR, K1EUI, W7GWA, W2GFE, W7KWU
(A fervent believer in preservation of geographic significance
of call signs)
My first radio was a crystal set at age 8 when I found that
precious pair of headphones in an upstairs closet in 1931.
Everything else could be made from Mother's Oat box and some old
transformer wire together with a "crystal" for one cent on "Radio
Row" on Arch Street in Philadelphia.
Later, of scrounged parts I built a 5 meter super regen
receiver and with a larger coil listened to 10 meters too. Got the
power from an old Atwater Kent receiver PS that had all the leads
cut off at the top of the tar in the transformer and filter cans.
Nearing first amateur license in 1939 I built a five tube
regerative receiver out of junked AM receivers and a beautiful table-
top radio cabinet; 58 TRF, 57 Regen Detector, 56 first audio,
2A5 speaker driver and 80 rectifier. Worked first shot. Put the last
component in and the 160 coils and there was Judy Garland singing
"Somewhere Over the Rainbow" on station near the top of the AM
band.
Transmitter was a 6L6 tritet oscillator. Only purchased part
was the Bliley BC3 Crystal for Christmas. First contact was on
New Year's Eve of 1939 on 40.
All wiring, coils, feeders, antenna and guy wires were from
a reel of ATT twisted pair remnants given to me by my Scout Master
who also supplied the magazine with the 5 tube regen circuit in it.

>The 64k$ questions are ...
>If I can find parts or do this myself, is it worth it?

I think so. You'd be better off to take this over to
rec.radio.amateur.boatanchors, which is the new ng for us firebottlers. :-)
Personally, while I have recent equipment too, I have several Hallicrafters
receivers, as well as other tube-type receivers, and they have certain
advantages over the newer stuff.

You'll get a lot of help over in r.r.a.b from guys who have these same radios.
They'll be able to help you get 'em in shape. I've got an S118 on the way
now, strangely enough...

>Can they stand tall against these new inexpensive SW recievers

Absolutely. In some cases, much better.

>or are my antiques a joke?

Not at all. Again, r.r.a.b is the place to go.

>If one has any collectable value, should that influence my decision?

Not really, but I sure wouldn't let go of them if they're cosmetically in good
shape and are within your scope of expertise to repair.

>I have to admit I am partial to my space heaters here.

Yep. You're a firebottler, then. :-) See you in r.r.a.b.

1109. Any reason for not using AVC on the IF tube of an AA5 radio?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-10-21 00:00:00 UTC
From: wa2ise@netcom.com
Message-ID: <wa2iseDzLxyn.H10@netcom.com>
Source record: 192306
Cross-posted to: rec.radio.shortwave,rec.radio.amateur.equipment,rec.antiques.radio+phono

When I was modifying an Emerson AA5 radio to use sub-mini tubes, I noticed that the bias on the IF amp tube's grid (thru the IF transformer secondary) was tied to ground, not to the AVC line. The antenna circuit is biased with the AVC on this set. An old radio friend says that the only reason he can think of for no AVC on the IF was to keep the interelectrode capacitence of the tube from changing on the IF secondary from varying AVC voltage. But you pay a penalty of less ability to reduce your gain on strong nearby signals. I re-biased the IF with the AVC, and it appears to handle strong signals better, less variation from weak to strong than before. Seems a slight de-tuning of the IF on a strong signal would not be noticeable anyway, as the user would tweak his way onto the station with the tuning knob anyway, and there'd be enough signal to punch thru a slight detune anyway.

We're talking about mid 50's and later AA5 AM radios here, and AVC was well understood and standard practice then.

Maybe Emerson was trying to sidestep a patent or something?

My intent was not to justify what others are doing. I was simply
pointing out that at least the "illegal" messages posted here are not
totally off-topic. At least they *relate* to amateur radio in some
way. I was merely pointing out that if this is the only problem with
"spam" in this newsgroup, then those that frequent it are rather
fortunate. A lot of groups are plastered with MLM scams and other BS
posts.

Not necessarily. If it's in a flying helicopter, it would be quite expensive to have an antenna on some type of motorized platform which would keep it aimed at the home base while in flight. IMO, it would be more practical just to broadcast the signal omnidirectionally.

Actually the helicopter in Portland Oregon uses a diection microwave link
to transmit it's TV and FLIR (Yes, KGW has FLIR-Incredible but true)
They even have a big website about the helicopter including the type of
microwave link

They probably bought the equipment at a bargain-basement price from some
military electronics contractor whose main business is drying up due to
budged cuts. I'm sure the development of this stuff was paid for by the
military, it would be far too expensive for someone to develop just for
the commercial market.

1124. Wanted: Comments on Yaseu FT 900

Newsgroup: rec.radio.amateur.equipment

A friend of mine would like to experiment with the diminuitive FT 900.

However, he would appreciate hearing any comments from any of you who have used the rig about how it performed. Since he doesn't have Intenet access, I volunteered to query the newsgroup.

Any comments, pro, con or indifferent?

Thanks in advance.

I get the impression that the Alinco ad is a one shot deal, and not the inventory (day-to-day) of a shop, My understanding is that a ham, or group thereof, is trying to put together a deal where these can be offered at a good price. Also, rec. radio. swap is not under the heading of rec. radio.amatuer in a lot of newsreaders, so with the equipment in the title is could be an easy stretch to assume that this is the place to advertise amatuer only equipment, especially if one looks into rec. readio.swap and sees the mountain of commercial gear. I don't think that it is a matter of inconsideracy or ignorance as much as an honest error, not worthy of flames. Perhaps, with the millions of new net users each day, a posting of the groups charter from time to time would help.

Hello Mike,

i bought the JST 245 about 1 1/2 year ago. During this time frame
i got 3 firmware updates because of the tx-delay for amtor and pactor.

I know only 2 mods for this trx:

1) enable the tx for total frequency coverage:
push the 50MHz button during power on and wait until you hear
3 beeps. This mod will be stored for all time.

2) calibration of the carrier frequency
push FUNC and LSB/USB

If you have additional informations, please let me know.

Eric,

I have several older tube type shortwave receives that I enjoy, both fixing and using, but let me relate this story. I am involved in the AFS exchange student program, and often times will find the schedule of the students home SW station and invite them over. Last year I had a girl from Paraguay for a year living with me. When she got here I drug a Hallicrafters R-274D military radio with bunches of tubes, I think it is a sx-88 but not sure. Anyway I have the schematic and alignment data, so I went through it, every tube, every electrolitic, and alignment, It worked great, she was able to listen to home almost every night with a 50 foot longwire antenna.

For christmas I bought her a Radio Shack dx75 I think, it was on sell for $75. I gave it to her and explained she could use it when she got back home to listen to english and keep her skills up as well as get news from the US. It had a little whip antenna, and only tuned 5 khz increments. She came in that night, Dad, Listen, it was radio Paraguay, coming in better with the little whip, than on the hallicrafters. I don't know if this is consistant, but that little portable out performed my hallicrafters, my Stromburg Carlson 5 tuber, my zenith Shutter dial, as well as my Radio Shack DX-300.

Did I go out and buy a new portable, no, I enjoy the old stuff, so if you enjoy using the old stuff, use it, but if you are after DX and rare stations, I would recommend buying a high end like the Drake R8a.

Have fun. BTW you may want to post this on the Boatanchors group as well.

Let me get this right, the guy is asking to transmit OUTSIDE the amateur bands, and you are telling him to get a real amateur radio???? Does this make sense???? Do you understand the term amateur????

I would suspect the correct answer would be to get a type accepted commercial radio for the frequency he wished to (and were licensed to) transmit.

Why does everybody want to modify their new radio to transmit out of band as soon as they get it home ? If you have a ligitimate need to transmit out of the ham bands, buy a type accepted commercial radio.

A couple of years ago, a ham in my area transmitted a call on the local fire / rescue frequency to report a car fire. He did this from his home, within easy access of a telephone. He was using an HT modified to transmit out of band. Unfortunately for him, he was observed doing this and was arrested by one of our fire marshalls on a charge of reckless endangerment because he knowingly obstructed emergency communications (and prevented a medic unit from obtaining a radio patch for medical orders by tying up the radio system with his unautyhorized traffic.)

I do not know what the final outcome was, but I have heard that a plea bargain was entered, substantial fines levied, and the offending gear destroyed.

In short, unless you are specifically licensed and authorized for a specific frequency (public safety or otherwise), stay off of it.

Just a random rant.....

Well, lemme see here [as he adjusts his head so the
sunlight doesn't blind him as it reflects off of his trusty
bi-focals...]

The switch on the left (or Driver's Side here in the People's
Republic of California) locks out the keypad from fumbling
fingers when whisking the radio up to your ear to see if that
last call was for you.

The switch in the center, the little three position jewel,
has to do with how/where the radio stops when in the
"scan" mode. Left-most will stop on "clear" channels,
center position causes it to stop on "manual", what the
hell ever _that_ is supposed to be good for, and right-most
position will stop when it detects a "busy" channel.

"Busy" or "clear", as used in the aboce context seem to
be pretty much the same as squelch open or closed.

The little switch on the right (Passenger's Side here in
the People's Republic of California - "Bed and Breakfast
for ALL!") sets the frequency step for the scanner - leftmost
for 25 KC steps, and rightmost for 50 KC steps.

Best of luck.

It has been reported that the firmware in the radio has been changed ,
not software, by the people that wrote software. Quote....
" The firmware inside the radio has been changed so that pulling the
plug will not toggle the radio into the European mode. This change was
made in radios with the 3rd and 4th digits of the serial number greater

than 05"
RT Systems"

I have the same nostalgic attraction to my Hallicrafters S-53. Today's
digital radios make listening and finding DX alot easier.

If I were you, I'd buy an inexpensive portable (Grundig or Sony) for
serious listening and fix up the old radios for fun.

Good Luck,

John, KB2YJH

1156. Help!!! Need info on the QB4/1100 tube from phillips

From: NewsRadio <jmckay@interlog.com>
Message-ID: <326D6225.38C1@interlog.com>
Source record: 192205

I have a number of Cellwave rubber ducky antennas for sale, most with unusual frequency ranges and/or connectors. Most are for sale at 10$ each. These are new, never used, but without packaging as they were demos for a trade show. Please e-mail me if you are intersted at jmckay@interlog.com

Some of the frequency ranges are:

821 Cellular, full band (tx/rx - 870)
806 Trunking, full band (tx/rx - 850)
406-420 UHF
118 VHF Air

Many are with BNC connectors, also some with SMA, some with threaded Motorola type, etc. There are about a dozen in total. Also, some are stubby types, some are full half wave whips, and some of the trunking/cellular ones are the hi gain type.

Nope, they are directional antennas and they are microwave. A number of
companies manufacture them with radomes over the antenna though, so you
cant see the moving parts. On the tower, usually the broadcast tower, the
receive antenna also tracks the helicopter. Its quite a complex system
with control equipment that keeps the two antennas aligned.

>
> The traffic helicoptors in the SF Bay Area are found between 450 and 451

Your thinking of the Radio broadcast. Or perhaps the tv audio from the
cameraman is sent on the 450 frequencies. All the video is up in the M/W
portion.

Harvey, the HW101 has no lack of drive when everything is "ok".
Check and see if your two "O" ring belts are slipping. I saw one HW-101
where they were deteriorated and loose and the separate capacitors were
no longer tracking together. That condition really threw off the
pre-selector and driver peaking.

I called Icom service and they sent me a fax of mods avaialble. I have an ICOM 2710 and have done these mods. They work.

Remove bottom of radio cover.

Verify D-139 is not present.

Cross band repeat:
Set the desired freq.,tone and offset on both bands.
Press [VHF] and [UHF] and the [SET] key at the same time (an L will appear on the display).
For zero hang time, also press the [LOW] key with the above mentioned 3 keys.

To exit cross band repeat: Press [SET].

To enable receive on all available frequencies: cut jumper W-18.

For extended transmitt ranges: contact Icom.

Source record: 192220

The Raymond Sarrio Company's Ham Radio WWW site has a very large data base of ham radio classified ads. ALL LESS THAN 30 DAYS OLD! at:

http://www.sarrio.com.

This new classified section allows Hams to search for equipement with the help of our new and unique search engine--no need to scroll through 100's of listing before you find that special piece of gear. Plus, when you find the gear your interested in, each listing comes with point-and-click e-mail access direct to the Ham that listed the item.

For those Hams with gear to sell, take note! It is absolutely FREE to list your equipment within the Ham Classifieds, and there will be no posting time delays.Your posting will go on-line, in our classified search engine,in about 1 hour. All you need do is fill out a simple forms page, and upon its (point-and-click) submission, your "For Sale" advertisement is on-line.

The classified listing are purged every month. So you know you don't have to keep coming back to repost every few days as is the case here at rec.radio.swap. Give it a try, and let me know how you like it. 73's Ray

It's very nice but has one bug. The cpu crystal is around 24.980- 25.08
but strangely it varies from rig to rig. The second harmonic wipes out
part of 6m and I mean wipes out. S9+ and noise sidebands +/-20khz so
don't try using a transverter. I've just received my replacment which
supposedly has the harmonic this time at 49.99 rather than 50.157 like
previous. My only moan. Check it first, just put a six metre rig close
by. Also check you aren't losing the top end of 12m. The fundamental
signal is very noisy and again 9+. Unfortunately Yaesu Japan don't seem
to care. Yaesu UK is taking a bit more notice.

Hello

I have just purchased a Yaesu FT8500 and I am very interested in programming the CAT port. The hex control codes look real easy to manupulate and it whould be relatively simple in Visual Basic..

Has anyone done any CAT programming ? I'd be interested in discussing ideas... I've noticed that I can read values from my FT990 like the "S" meter but the FT8500 doesn't appear to have any fields I can read from ?!? Any ideas ???

Thanks..Pete..vk2yx

(Verdi Wahjosoedibjo) wrote:

I tried the "mother of all mods" described by KE6VVW in
http://members.gnn.com/hca/ft50/ke6vvw.txt, but no joy.

I suspect that the ADMS-1C software "bug" that leaves the radio
in Euro mode has been fixed in version 1.05. My radio would not
go to Euro mode when I disconnected the adapter cable in the
middle of transferring USA.RDF.

All I can get is:
RX - 76 to 200, 300 to 540, 590 to 869, 894 to 999 (MHz)
TX - 140 to 174, 420 to 470 (MHz)

Not to shabby, but I'm really interested in plugging 200-300;
I wonder why Yaesu didn't enable that in the first place,
after all, there's a 220 ham band there...

I guess I'll have to find someone in my vicinity that has
version 1.04 so I can get the super wide band rx mod going.

I have had one for several years now, and I don't see anything that I would replace it with. The Icom 706 is like the TS50, not enough adjustments on the front panel. I like the way my rig operates, I love the display and peak reading meter. It works great as a base/mobile unit. If you hae something specific you would like comment on, please let me know.

I have an FT 900 AT, not the CAT, but I really like this radio. I shopped around for a long time before I bought this one. I like the way the display works, especially the peak reading meter. CW is great with this rig. I can't find any real big gripes, but then I compared it with everything out there that I could, so I felt it made the best rig for me. If you have anything specific you want me to comment on, let me know. 73 de KC7IGE

I agree with all of the above. I also have an FT-900. The other thing about the 900 is that it appears to be the most ruggedly built HF portable radio on the market. If it isn't milspec I'll bet it is darned close to it.

The 900 provides a very small package that nevertheless can serve without apologies as a full base unit. It cuts few corners, while not being horrendously bigger than the TS50 or IC 706.

I remember a recent thread running on this topic and having lost an FT980 last summer in a burglary various thoughts/ideas have been in the back of my mind.Most notably:- ......
.......The majority of modern transceivers include microprocessor control so why can't the firmware include password protected access to key features in the same way as computers have password protection of keyboards,screensavers etc.I would see this operating like a digital house alarm i.e. delivered with a factory default access 4 figure digit such as 9999 on the number pad to gain access,thereafter to be changed to the users choice.I'm no software engineer but wouldn't imagine this to be a big deal as far as programming the firmware goes and as long as the feature is advertised would reduce the sell-on value for a thief to little more than spare-parts value.Just a thought......
While on the subject of transceiver microprocessor power, why don't manufacturers include a digital clock on the readout?Save me fumbling around for my watch,adjusting for UTC etc everytime I need to make a log entry....
Cheers....Stewart Rolfe - GW0ETF

I use a KPC-3 for packet on my IC-2000H. The KPC-3 I got used
for $75 and works like a champ. There is a command that allows the
KPC-3 to operate with squelch open. The pin outs for the IC-2000H are
in the manual but in case you do not have it.....

1. +8V DC output
2. Frequency up/down
3. AF detector output
4. PTT
5. GND (Microphone ground)
6. MIC (Microphone input)
7. GND
8. NC (No connection)

Thanks for the reply Rod. Good to see RT Systems is reading this group.

Turns out my 3rd and 4th digits are 10, so that problem is solved.

Can you tell us if a software fix is planned for the following:
squelch is set to "zero" during a download
rtime is set to "off"

It would be nice if we could set these with the software and not have to
reset each time we download. Overall I'm very pleased with the software!!!

TIA

1193. High Power Mobile

Newsgroup: rec.radio.amateur.equipment
Date: 1996-10-23 00:00:00 UTC
From: bclongwell@delphi.com
Message-ID: <9610222212591.The_Win-D.bclongwell@delphi.com>
Source record: 192130

Anybody care to share their high power mobile experiences ?

Right now I have an IC-706 and a Screwdriver antenna in my 1996 Blazer. I've been giving some thought to adding SGC's 500 watt amplifier. (With a second battery next to the amplifier).

The 100 watt level doesn't affect the vehicle, but I wonder about what might happen with those 500 watt rf peaks. I plan on using the extra power on 40m and 75m, so ther ERP will be considerably less than on 10m. But there is all kinds of RF loop possibilities inside the vehicle potentially setting off the airbag or, worse yet, making my FM band radio switch to oldies stations.

Then there is also the concern of the repeated exposure to higher RF levels. (I spend a lot of time on the road, and this is where I do 99% of my radio operating). I know that there are plenty of old-timers that give you the "I've been in ham radio ever since I helped Marconi put up his antennaes, and the RF hasn't had any effect on me". At the same time, I know plenty of people that have done acid countless times over several decades and they make similiar claims. The ones that have contrary experience tend not to be around to offer a desenting opinion.

>

Well for most people, I expect the answer is "because I can". Some people may
have occasion for commercial communications which they can't do on the amateur
bands, but can do on other frequencies with the appropriate license (setting
aside questions of type acceptance for the moment). And some HT's can operate
on GMRS frequencies (again with the right license), which can be used for
purposes not legally permitted in the amateur bands. Re type acceptance-
you're right of course, but it's a pretty hard sell to convince people to go
out and buy one or more additional radios (some of which can be
quite expensive) when they've already got one that almost certainly does job
just as well, and for which they already have all the accessories etc.
Not saying that it's right or wrong. Just saying that there's at least a
couple of reasonably understandable reasons for why people want to do this.
Of course one other reason is so that they can 'play' out of band in the
totally illegal sense. In the story you mentioned, the guy is just plain
dumb.

As for myself, I just bought the first VHF and above radio I've ever had that
could easily cover beyond the ham bands.. and I am having a good time
listening to the commercial and public service frequencies. I haven't
operated (transmitted) out of band because I have no reason to. But I am
interested in GMRS which I know the radio can do. I don't have a GMRS
license, but if I did you'd have a hard time convincing me to buy a separate
radio, with all the trimmings- extra batteries, charger, headset, case, etc..
probably about a $300+ investment for a radio that does only one job, and not
as well as the modern amateur HT I just got. Especially when I know that some
of these manufacturers are selling these very same radios with different
firmware or just different flash ram settings for commercial use. Legally
there's a reason not to do it, but technically it's a hard sell...

I have a few older Motorola cellular phones lying around the house, and was wondering if anyone has experimented with these (other than tearing them apart completely for the more basic components) to make them useful as amateur equipment or otherwise.

Also think somewhere I still have a Motorola VHF IMTS phone which if I can take it down to two meters could make a nice packet tranceiver... Also I think I can get my hands on a Harris VHF IMTS phone for the same purpose.

Any pointers toward resources (magazine articles etc, or personal experience) would be interesting to me. Also, if someone has knowledge of this, I will post the model numbers of the TR's.

I have a FT-757GX with the CAT interface and it doesn't have any outputs
either. The CAT interface is solely for changing frequencies. It's
probably the same for the 8500.

Yaesu (US) have a web page at <http://www.yaesu.com/> that might have
some more details about your particular model.

>
>Maybe Emerson was trying to sidestep a patent or something?

Amazing! Sounds like an attempt to reinvent the wheel by giving it
square corners. IF gain is the primary place to control RF gain in a
set.

The circuit that is most affected by AVC detuning is the local
oscillator, and in larger sets with an RF preamplifier and multiple
IF's (RME-45 is an example) the AVC bias is omitted from the mixer
stage, and fed to the RF and IF stages. The stage that swamps on
strong signals is always the final IF. I wouldn't hestitate to rewire
the AVC into the IF in an AA5. You have about ten volts maximum AVC
available in a set like this, and need to kill gain in two stages to
get effective control.

Source record: 192137

Just picked up a Kenwood R-1000. Not very much documentation
came with the radio since it was given to the previous owner
by a neighbor. Any comments on the radio or place I can check on
the net for its particulars. Any Mods worth looking into? Can it
be Computer Controlled? Would I want to?

Thanks

Rich

Hi FT-50R Owners,

As proud owner of a Yaesu FT-50R with the optional ADMS software, which I bought three weeks from
HRO in Oakland, I would like to set up a web page of various "rdf" (radio data files) that other
proud FT-50R owners would like to share with other owners. Thus, owners from the same towns or
city would be able download local "rdf" from my page by picking a city or county.

If you would like to contribute a "RDF" file, please send an e-mail to amran@ix.netcom.com with
the file(s) as an attachement. Or if you have any suggestion, please feel free to e-mail me.

Thanks, Amran

Here are 2 i found
http://www.geocities.com/Hollywood/5860/
--
Dave Booth
I bought my ft-2200 a few months ago and I didn't have the AM
recieve
activated. So I complained and got the mod for it:

AM receive:

1. remove top and bottom covers, then remove speaker.
2. Lift the faceplate retaining tabs on top and bottom
to
slide the face off (pull the knobs off first you
knob).
3. remove the retaining nut on the tuning shaft and
lift
the clear plastic light guide off.
4. The 12 surface-mount sized jumpers are now visible.
5. If AM is disabled, there should be a jumper across
number
5. Remove this and reset radio before use. (I
think it
is number 5, my radio had only one jumper in place,
and
it was the one for AM block-out. If you have more
than one
in place, contact me and I will give you the
double-checked
version of this mod.)

Now, if you enjoy this mod, please send me any more that you
have
heard of for this model. I would like a wide open radio to experiment
with
it's power output across the spectrum. I need FM Rx and Tx extended.

Is it common for a radio to require a jump *made* instead of just
cut? This
would have to be the case for this model since it doesn't have any
jumpers
soldered into place. (12 pairs of surface-mount sized/spaced pads
numbered
from left to right).

thanks in advance!

1218. Yaesu 757 GX frequency stability problem

Newsgroup: rec.radio.amateur.equipment
Date: 1996-10-23 00:00:00 UTC
From: johnkg@nortel.ca
Message-ID: <54lnhc$nue@bmerhc5e.bnr.ca>
Source record: 192155

I have a Yaesu 757 GX and it has a problem with frequency stability.

From time to time the frequency being received (or transmitted) will change by about 300 Hz up or down. Often it will return to its previous value after a time which may be short or long. It makes it quite difficult to listen to a specific frequency and very annoying to people listing to my transmissions!

I have not been able to find anything that will make it do this frequency change on demand. It will do it warm or cold, on any of the bands and transmitting or receiving.

Does anyone know of any 'standard' problems that might have symptoms like this?

I will check this newsgroup from time to time but would appreciate direct email as then I am certain to see it.

John.

>Just a random rant.....
>
>Matt N3MCZ

But a well placed random rant.

I have a modified TS140 which can transmit out of band.
I bought it that way, and didn't really care since the ham bands
worked fine. I have resisted the temptation to transmit on areas
outside of the Ham bands (especially in the 11 meter range, mostly noises
from the Planet Insanity). I do however plan to use the out of band
transmit capability for a real cause. Since my power output can be turned
way down into the QRP levels, I plan to use the radio with a homebrew 2
meter transverter, and didn't want to do the conversions from the 10 meter
coverage to the 2 meter coverage. Instead, I plan to use the 14 to 18 MHz
range of coverage as the input to the transverter, that way the readout is
easier to read with reference to the 144 to 148 range of 2 meters. If I
do it right, I should have a fairly nice 2 meter all mode.

In general, I don't believe that this is the reason that everyone wants
the mod information, but it is mine. In our area, there is an individual
who transmitts regurlarly on 26.185 MHz and occupies about 4 MHz of
bandwidth on either side. He uses it to broadcast old (really old)
country/western tunes, and cuss at the truck drivers. He has told people
on the air that he uses a modified TS690 with an outboard 300 Watt amp.
A waste of a good rig, by a misguided individual in my opinion.
(He is hard to RDF too, gotta build that attenuator soon).

>says that the only reason he can think of for no AVC on the IF was
>to keep the interelectrode capacitence of the tube from changing
>on the IF secondary from varying AVC voltage. . . .

>Maybe Emerson was trying to sidestep a patent or something?

Another thought comes to mind. Putting AVC on the IF increases the amount
of IMD (inter-modulation distortion), because it will prevent the AVC
voltage from going as high, and therefore will leave the RF gain higher.
I'm not at all sure this was the reason, just a thought.

In another reply to the original article, grg@boombox.micro.umn.edu (George R. Gonzalez)
writes:

>BTW its seems amazing to me that they can put AVC on the converter
>tube and it doesnt detune it at all.

Do you mean de-tune the oscillator or antenna? The oscillator is typically
between the cathode, grid 1, and ground, and should to first order not see
any effect from the AVC on grid 3. The antenna probably is de-tuned somewhat
by the AVC, but then again it is also de-tuned by presence of nearby objects,
imperfect tracking across the band, etc. The antenna tank is generally low
enough Q to accomadate a fair amount of de-tuning.

There are no mods except for changing the bandplan to the USA version
via the diodes visible when the faceplate is off and the access door is
also off. The most you will get from this rig is rx and tx from
144-148mhz. There is no ability to receive out of this range.

As a follow up...
I finnally got thru to Motorola and they quoted the manual and said it will tune to 450-470 MHz with a spread of 6.5 MHz. So has anyone tried to program this thing below 450???

Again TIA,

Hi Curt,

I have an MFJ artifical ground that I bought to tune the counterpoise wire I'm using with my Hamstick mobile antennas out my apartment window.

I tune the unit for maximum current in the wire. The results: I have no clue whether is does any good at all! I suspect not.

It cancels the reactance in the counterpoise. Sometimes cancelling the
reactance can help the counterpoise "work". Sometimes it won't.

I am selling a National HRO-M. This classic receiver comes with 8 coil sets (48-96KC, 100-200KC, 180-430KC, .9-2.05MC, 1.7-4.0MC, 3.5-7.3MC, 7.0-14.4MC, and 14.0-30MC). It has a wood rack that holds seven of the coil sets. The receiver appears to be complete but does not have an external power supply or speaker with it. It is untested. There is one control on the front panel that I believe has been added.

You can see a picture of this set, and some other Nationals I am selling, at my website:
http://www.geocities.com/SiliconValley/3839/radio_fs.html

I am taking offers on this receiver until Sunday, October 27, 1996. So far, the highest offer is only $150.

Greg Farmer

The UHF Mostars are programmed with a "special" RIB box known as a MIB (Mostar Interface Box). I have programmed several, but, the UHF version will only program (using Motosoftware) to either 447 or 449, I can't remember which. I have looked at tricking the archive to allow a lower freq without any luck. They are not a bad little radio, just haven't been able to use them anywhere but the commercial band. Good GMRS (CB) radio for someone though.

Well, I won't speak for him, but as someone who *agrees* with him, I'll simply quote what may well become the third law (motto) of the Tar Heel Scanner/Shortwave Listeners Group:

More radios is always the best solution. :-)

My most recent acquisition was an heavy, monsterous and wonderful EAC R-390A, and I also have a Hammarlund HQ-180C and a Zenith T-O of the tube genre, but I still want and use a Sony 2010, a Yupiteru MVT-7100 and a Kenwood TS-940 (ham transceiver with general coverage receive).

Each of these has its own charms, and of course I "need" them all. :-)

Hi Jim. This is true if the feedline impedance is different than that of the antenna/transmitter. If you use 50 ohm feedline with a 50 ohm antenna/transmitter, any length is acceptable. If you substituted say, 75 ohm feedline, you would need to cut the feedline in 1/2 wl multiples (the impedance is repeated every 1/2 wl).

Curt,

Those devices merely tune out (cancel) the reactance in the wire running from the radio to the actual ground system. While this reduces RF problems, like a hot mic, it does nothing to improve the actual ground system.

>what's on the far end.

There's one more way that cable length can affect VSWR. If common-mode current is present (that is, current is flowing on the outside of coax, or the currents in twinlead aren't equal and opposite), the feedline becomes part of the antenna. In that situation, changing the length of the feedline changes the antenna itself, which will affect VSWR.

VSWR can seem to change with cable length if the characteristic impedance of the VSWR meter isn't the same as that of the cable. I've measured RG-58 at over 60 ohms Z0, and a couple of cheap SWR meters I've looked at were off also, so I imagine this is a fairly common occurrence. In this case, the SWR doesn't really change with feedline length, but the SWR meter says it does.

1263. ICOM 735 to AT120 tuner - help!

Newsgroup: rec.radio.amateur.equipment
Date: 1996-10-24 00:00:00 UTC
From: Bill Taylor <btaylor@toad.net>
Message-ID: <326F3CDA.4B17@toad.net>
Source record: 192000

I use an ICOM AT120 automatic antenna tuner with an ICOM M600 marine SSB for shipboard communication. Now that I have my general class licence, I want to connect an ICOM 735 to the tuner but have run into many problems. Apparently ICOM made a unit to do this which was called an AH2. The AH2 was a controller interface plus the AT120. ICOM has discontinued making the AH2 and does not even have a schematic of the controller. Basically, the controller started the AT120 and also sent a signal to the 735 to automatically reduce output power to 10 watts (on Accessory 2 connector) during the tune cycle.

Hopefully, someone out there will have solved this problem. Thanks and 73,

Bill N3XYS

Howdy Dave --

I believe that he's talking about an SB-220. I've never owned one but
there are thousands of them out there. Bear in mind their power was
rated the old fashioned way by power drawn or power INTO the final a
little misleading by today's standards of power OUTPUT -- more
meaningful number.

The 3-500Z is a great nearly bulletproof tube which generally lasts
for years of normal use. The '220 was a great amp but did not have
some of the "modern conveniences", although I think it did have ALC.

Ther are several outfits around that offer after market mods for them
to increase life of tubes and operating convenience - they advertise
in QST.

The SB-220's seem to go for about $500.0 plus or minus.
Good luck with it.

>Other mods are welcome too, off course.
>
>Thanks in advance,
>

Well so far two people replied, but both of them wanted
to know more about the radio themselves:

I have the radio since 2 1/2 weeks and I like it a lot.
The other two radios that I have are a Kenwood TH78a and
a Radio Shack 2m Handheld.
What I like about the ICOM is its size, easy of use, and the
antenna provided with the American version seems to be fairly sensitive.
The battery seems to work well too, but then, the radio is still brand
new...

There are a couple of things you will not find on this radio.
One beeing crossband repeater function (which the TH78a has).
It allows you to send out DTMF codes ranging from 0-9 A-D, but it does not
seem to have the capability of receiving DTMF pages. On the other hand,
I do have this feature on my TH78a but I never used it so far.
(When I was recently in Munich, Germany, I found a repeater that has
electronic voice mail on it - beats the hell out of any pager function,
since you do not have to leave your radio constantly on, in order to
receive messages).
You can do tone squelch and in one particular setting, the radio will ring
like a beeper or a phone, if the squelch is broken (but only once - as
soon as you hit PTT, the function gets turned off until you reset it).

Other features: It has a tone code scan funtion that allows to detect
subaudible tones transmitted with repeater input signals - so no
kerchunking anymore until that damn thing opens... :)

And her a little bonbon:
There is at least one mod on the radio:

By pressing 'Band' - 'Moni' and 'Power on' at the same time, the radio
will set itself to were it can receive from 50MHz - 999Mhz with exception

of the cellular band and the 200-300MHz range.

I have looked inside the radio for any suspicious diodes or wires to remove, but haven't seen any. The radio looks very rugged on the outside, and the interior is a beauty to look at: Very compact and clean. No danger of parts falling out or wires ripped offf when you open that thing.
Just remove the four screws in the back wall and four more underneath the battery pack - and there you go....

Well, yes, my Kennwood does have more functions, but it is very cumbersome to use. Therre were so many times when I wanted to program something but I didn't have the manual handy...
B.t.w.: when you convert a TH78a to TH78e you loose crossband repeat function and extended receive. I have not managed so far to find a combination of diodes that will permit both.

Any more questions?

Regards, Arne Reykowski

PS: I am still looking for those mods...!

The Delta 2 is a great radio but has some limitations. I didn't like the
AM detector. The buttons are not
positive and take alot of push to make contact.
It's a very quiet but hot receiver. On CW, there are not too many rigs
that compare to the silky smoothness
of the QSK operation. It is made well.

Have owned: 940, 765, 735, 728, 450, Omni 6, 850, TS-50, Delta II and
IC-706.

Source record: 192084
Cross-posted to: rec.radio.shortwave,rec.radio.amateur.equipment,rec.antiques.radio+phono

Another method used to avoid second IF stage overload is to return the bottom of the second IF amp's grid drive (interstage IF transformer secondary bottom) to a resistor of, say 1 Meg and a capacitor of about 0.01 uF to ground or to a bias voltage. In this way, this stage will bias itself negative when it starts into grid curent, staying just short of clipping on strong signals.

Hello Rich. I have a Kenwood R-1000 receiver. I have never seen any info on the web about it. I have done searches. Might be something out there that I missed. AFAIK, the radio can't be computer controlled. It has no interface port for this purpose. I like mine, though. It's a nice simple radio and performs well. Maybe others have more info for you.

Not a bad idea. I will as soon as my 50 comes back from the shop.
Seems to have gone deaf after only 4 days. I would suggest that
people include the first 4 digits of their serial number and what mods
they have done along with the file. The first 4 digits are
significant to the template of the radio, and the mods and options are
as well.

1276. Importance of coax length on HF A myth?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-10-24 00:00:00 UTC
From: jpoll@redrose.net
Message-ID: <54nc7a$s6@lily.redrose.net>
Source record: 192089
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc

Hi.

I have a friend who swears up and down that the length of the coaxial cable to maintain resonance at a given frequency is important for reducing the SWR. He feels that it acts in a similar principal to the fact that the elements of an antenna must be cut to the correct length for the antenna to be resonant at a given frequency.

It seems to me I have also read somewhere that this is a myth. I need the true scoop on this. I'm preparing to put up a pretty good antenna system on my roof (a homebrew 10 meter antenna cut to exactly the middle of the band), and don't want to purchase an extra 6 ft of Belden 9913 coax only to have it looped up and losing signal, when in reality I could of used 20 feet instead of 26 feet of cable.

Please carbon copy any responses to this post to jpoll@redrose.net so I don't miss any good info.

Thanks

Jim

1277. FT-8000 audio problems anyone?

Newsgroup: rec.radio.amateur.equipment

From: bpaul@qualcomm.com
Message-ID: <54n8n3$jsc@qualcomm.com>
Source record: 192090

I looking for any feedback on the Yaseu FT-8000 anyone can give me. I bought one a few months ago, and had some problem with the audio on the left side receiver after having it about a week. I returned it for another and have noticed a different problem, but once again with the left side audio. At this point, I would have to send it in for repair, but would like to first find out if anyone else has had similar problems and if they were resolved.

The problem with the first radio was the audio on the left side receiver would be about half the volume it should. It started out as an ocasional problem, then grew into doing this about 90% of the time.

The problem I am having with the current radio is the audio on the left side receiver has a 'worble' sound to it. It took me a while to realize that it was my radio since it was at low volumes compared to the person I was listening to and it sort of sounds like the other person has a something loose in their microphone. This problem has also been intermitent to about 40% of the time.

Thanks in advance,
-BP

He is just stating the facts.

Even if one could come up with a lame excuse as to why they need the tx
capabilities out of the ham bands they still cannot use the radio there
because it is not type accepted.

Joe
The 212 and 242 are both very capable rigs with superior resistance to intermod. This is due to the lack of the "super wide receive" found in other rigs.

1279. Re: spot frequency reciever

it would be better to buy a complete receiver circuit board from
hamtronics or ramsey, and then buy the crystal to lock it on channel.
you don't specify whether you want narrow fm (NBFM) or wideband (WBFM...as
used by FM and TV stations). The NBFM can be gotten from ramsey and hamtrx
but wideband reception would require a built radio (ICOM 7000 and 7100 for
instance).

1280. [WANT OPIONION] Yaesu FT8000 vs FT8500

Newsgroup: rec.radio.amateur.equipment

I'm looking into purchasing either the FT8000 or FT8500 mobiles in the next couple of months.

First off, I have a 1997 Ford Escort. Are there any known problems between this escort and either radio?

I am a big scanner enthusiast, so I'm headed towards the 8000. I currently have an ICOM 2AT as my transceiver and a Uniden Bearcat 800XLT scanner. Both are powered from my cigarette lighter. I'd like to toss them both aside and put in a single radio instead. Using these radios when driving can be someone annoying.

The Bearcat has nasty out-of-band interference when scanning. I'm hoping to get rid of that with the mobile. I'd get a separate scanner and transceiver, but the flexibility of the FT8000 seems cost effective and function sufficient for me. I live in a good-size city.

Can the 8500 be modified for the receive capability of the 8000? If not, I pretty much have my answer.

Thanks for any input on these models.

The IMTS stuff have a duplexer in them. In the days before dual
band radios, folks built mini-mobile repeaters, or low power
cross-band things. Good for 25 watts.

-Even if one could come up with a lame excuse as to why they need the tx
-capabilities out of the ham bands they still cannot use the radio there
-because it is not type accepted.

While it is true that most hams do the out-of-band TX mods "because they
can", there are some very legitimate reasons why I have done so on a
few of my radios - all legal!

* Icom's views of the ham bands are different than the FCCs. I had to
do the mod on both my 24AT and 3230 to transmit in the 430-440 part
of the band (satellites, our repeater's control link...)
* Driving transverters - Since the ham bands are not always exact multiples
of each other, you may need to go beyond the band edge (or even somewhere
way out of the ham bands) to drive the transverter. If the base freq
doesn't escape, it is legal, since all you are transmitting with is the
transverter's output
* As a signal generator or test source in the screen room at work - again,
there is no leakage...

And of course, I do use the out of band RX capabilities often...

This still does not change the fact that ham radios are NOT TYPE ACCEPTED
on ANY freq outside the ham bands and should not be used as radios there.
(usual exceptions for life-threatening emergencies and MARS...)

I have a RS PRO-46 handheld scanner that I am desperately trying
to part with. The unit is in good shape and I am the original owner. There
seems to be a slight lack of sensitivity in the 170MHz range, but there
isn't much activity out here in that range. I have the original box for it
and must admit that I don't know how much they are going for used. So
someone make me an offer. Oh, before I forget, it has NOT YET been
modified in any way to allow reception of cellular. This you will have to
do yourself as I value my license too much to take the risk.

Thanks,
Joe Denison

>reality I could of used 20 feet instead of 26 feet of cable.

Ok, this can get complex because there are several interrelated
things happening here. Lets take them one at a time.

The only thing that determines SWR on a transmission line is
the ratio of the characteristic impedance of the line to the
impedance presented by *the load*. Nothing you can do at the
generator end can affect SWR, and changing the length of the
cable won't change SWR either (but see below).

However, changing the length of the line will change the impedance
presented to the generator. That's because a transmission line with
any SWR other than 1:1 acts as a transmission line transformer. By
changing the length of the line, you get an effect similar to, but
not quite the same as, changing the turns ratio of a transformer.
The SWR doesn't change, but the impedance presented to the generator
does. This can be useful, and is employed frequently for impedance
matching purposes. The most common such is the quarter wave matching
section.

In general, the impedance transformation will be complex, IE it will
be in the form of R+jX, where X can be capacitive or inductive depending
on cable length. The Smith Chart can be used to determine the transformation
effect by following the constant SWR circle around the chart for different
cable lengths (measured in wavelengths at the frequency of interest) and
reading out the R and X values. Note that the SWR is constant, but the
impedance presented to the generator changes with varying cable length.

Now something else can happen too, and this is where some of the
myths have arisen. If you feed a balanced antenna, such as a dipole,
with an unbalanced transmission line, such as coax, the *outside* of
the outer conductor of the transmission line can become part of one

arm of the dipole, and antenna currents can flow down the outside
of the transmission line.

Picture the dipole as a 1/4-wave section connected to the coax inner
and an L shaped element consisting of the other arm of the dipole and
the *outside* of the coax outer conductor. This can change the *load
impedance* presented to the transmission line because the antenna geometry
has been altered from a physically balanced dipole configuration, and
thus can change the SWR. Changing the coax length changes the effective
length of one leg of the dipole, and that changes the impedance presented
at the load end of the coax, and that changes SWR in the coax.

Coax transmission line currents flow on the outside of the inner
conductor and the inside of the outer conductor. This is because
of skin effect. The physics of coax forces the currents to be
equal in magnitude and opposite in direction. The opposite currents
cancel any radiation fields, and the coax doesn't radiate. But that
doesn't affect currents flowing on the outside of the outer conductor.
Those currents are independent of what's happening inside the coax.
Their radiation fields aren't canceled, and the coax becomes a radiating
part of the antenna.

Generally, it is undesirable to have antenna currents flowing on
the outside of the coax because it will alter the radiation pattern
of the antenna, alter its feedpoint impedance, and because it can
cause "hot shack" problems in some cases. The cure is to use a choke
balun at the antenna feedpoint to decouple the outside of the coax
from the antenna element to which the inside of the outer conductor
is connected. (A choke balun can be simply a few turns of the coax
tightly coiled just before connection to the feedpoint. Or it can
consist of a number of ferrite beads slipped over the coax near
the feedpoint. Its purpose is to act as a high impedance to currents
trying to flow down the *outside* of the coax outer conductor.)

When you use such a balun, or if you are feeding an inherently
unbalanced antenna such as a groundplane mounted vertical, then
the coax doesn't become part of the antenna, so it can't change
the load impedance presented to the coax, and thus can't change
SWR. Any length coax can now be used without affecting SWR, or
antenna radiation pattern.

So you can see, there is some truth to the myth that coax length
can alter SWR, but it isn't quite the way many amateurs picture
it. The reason it can happen is because the coax has become an
unintended part of the antenna due to a failure to properly deal
with the unbalanced to balanced connection at the antenna feedpoint
with a balun.

The length of coax doesn't change the VSWR, assuming it's all the same
impedance. However, the impedance at the transmitter output will be a
function of cable length if the VSWR is not 1:1. Ultimately what
matters is not the VSWR, but the impedance match to the transmitter.
All that is required is a conjugate match so that the transmitter sees
a resistive load of the right resistance at the output device.

There is one way that the coax length affects VSWT. If the attenuation
is high the VSWR gets better with length. Someone once said a good low
power load for 144 MHz is 100 ft of RG-58. It doesn't matter too much
what's on the far end.

In general, the correct length of coax for an HF antenna is the
distance it takes to get from the transmitter to the antenna. Don't
worry about length.

1307. Question on PL codes

Newsgroup: rec.radio.amateur.equipment
Date: 1996-10-24 00:00:00 UTC
From: tsarah@gwis.com
Message-ID: <54oiul$218@gwis.com>
Source record: 192120

I travel a bit and find it hard to determine what PL codes are used on various repeaters in strange cities. I have all the good books but not all the codes are listed. I was wondering if there is anything around that you could plug into a speaker jack that would display what PL code a repeater is using. This could be a commerical item or something that I could build. An ideas?

It's possible to use a cable with an impedance not equal to the characteristic impedance of your antenna and rig. For example, a half wave length of 75 ohm cable will work between a 50 ohm antenna and a 50 ohm transmitter. You can also use 75 ohm cable to match a 100 ohm antenna to a 50 ohm rig by cutting it to the right length. Unfortunately, these tricks generally only work at one frequency.

In this case, the length of the cable is critical to a given frequency.

Source record: 192123

I've had both Bob - I prefer the KPC-3 - but NO WINDOWS SOFTWARE if that matters to you. Actually traded it for a PK-12 because of this. For my money (and I have) I would get the MFJ 1270C for the same money. It is expandable to 9600 and is more generic in operation. Probably one of the best 9600 bd operations on the market when you add their PACCOMM Made genuine G3RUH modem.

IF you need protable operations though, the KPC-3 will run on a 9V battery but you have to add the battery clip yourself.

I've had all three - for home use - get the MFJ - for portable use - get the KPC-3 knowing that you can't upgrade it at all.

talking about!
The ONLY time coax length makes a difference is when it is radiating
rf,thus it becomes an active part of the antenna,instead of the passive
conduit it is designed to be.

Sometimes we spend way too much time performing analysis on a problem rather than using common sense. I've been a licensed amateur radio operator for over 30 years and have worked in commercial broadcasting and two-way radio for almost as long. The correct length of coax cable IS "the distance it takes to get from the transmitter to the antenna."

While others will argue the technical merits or matching this an that, in the "real-world" it makes very little difference.

Oh well, sit back and wait for all the techno-wizards to dispute this discussion but I know what works and it works in 99% of the cases involved.....

1326. Good Ole American Ham Gear - Where?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-10-25 00:00:00 UTC
From: akent@bga.com
Message-ID: <54ri9a$11f2@news3.realtime.net>
Source record: 191939

Is there a company in the US that manufactures comparable gear to the Japanese for any ham bands?

I have seen adds for all of the Japanese stuff, but not much US stuff in the mags. The only one I have seen is Ten Tech. Are there others here that compete?

I do own a Ten Tech VHF unit. It was a kit, and lacks the features of all of the fancy Japanese units you are familiar with. While it works very well, it lacks the bells and whistles it's counterparts have, being built overseas.

Are we dead in design and production of a really leading edge product for hams? I'm not only talking VHF, but HF as well.

Kent - de KC5WPW

1327. Uniden 8500XLT mod.

Newsgroup: rec.radio.amateur.equipment

From: sba3020@InfoNET.st-johns.nf.ca
Message-ID: <54rf3a$j3l@coranto.ucs.mun.ca>
Source record: 191940

I don't have the cellular mod for the BC8500XLT but I have recently found an old newsgroup message from someone name Jon who claims to have a mod to enter out of band frequencies on the 8500 between 25 to 1300 MHz including the blocked out 800 MHz parts. He claims to have already modified two BC8500XLT scanners. The message only talks about the mod but does not include it.

I don't have this person's e-mail address but he goes on to say that he will be contacting Popular Communications to see if they will mention it in an up comming issue.

What I would like to see if someone has all the Popular Communications between 1993 to 1996 and check in several places that it might be, like the scanner column or letters area. Assuming that he contacted them and they published it.

If someone does find it, knows of a similar mod or knows of this person please E-mail me.

Hi Joel, got to nitpick a tad.

1. 100ft of RG-58 on 440MHz with an SWR of 1:1 and *no feedline radiation*
does make a difference.

2. 100ft of RG-58 on 28MHz with an SWR of 20:1 and *no feedline radiation*
does make a difference.

Well,
Let's if I can do this reply. Yes, It's a myth! The only thing that's changing is the APPARENT XL-XC that the METER is seeing. We all know that the Electrical wavelength recurrs at a different distance than the phusical wavelength. The old velocity factor trick affects that (cheaper coax = lower VF). So, the loss is cumulative to the length, the SWR associated with the coax = myth.

If you want to play with the numbers of length, coax type, swr, ant gain, and effective power. Download TEEREV.ZIP from the ARRL BBS, or it's on the latest level of the QRZ CD-ROM.

Jim WD9AHF

P.S. I agree with the guy who said the correct length is what reaches! Just make sure that you look at what it costs. I wrote that TEEREV program to see what the tradeoff was between good coax vs an amplifier. You will be surprised at what the cost of 'cheap' coax is.

Jim
If the coax is matched (ie the load presents a resistive, 50 Ohm impedance) then the length of the coax is unimportant, except that it has loss depending on how good it is and the operating frequency. If the load is not matched properly then there will be different impedances at different points aliong the coax and you will get a different SWR with a 50 ohm source, depending on where you feed the coax. So your friend is correct if the load is not m,atched accurately.

<< I am wondering about those "artificial ground" boxes do. I'm thinking
it fine tunes a counterpoise (maximum current in the wire) for the
frequency in use...? You've seen the MFJ and Ten-Tec units.
Any ideas?...homebrew? >>

That's what they do. I've made a couple of them and found that they can be very effective in suppressing RF in the shack. I operate from from a qth where the antenna is in the attic about 8 ft above me, and I use a homebrewed one with good results. I made it out of a coil and variable capacitor hooked up in series, just stuff out of the junk box. The lead to the counterpoise goes through a toroid pickup in series with a diode rectifier and a meter, and you play around with the capacitor and coil tap to get a maximum reading. The counterpoise itself is cut for a quarterwave on 20 where I do most of my operating, and a small adjustment of the cap covers the band. I would guess that there's an optimum LC ratio for highest efficiency, but I haven't looked into that.

Whoa! There most certainly IS Windows software for the kpc-3.

KaWin fully supports all Kantronics TNCs that support the Kantronics Host Mode interface, and that includes all kpc-3 versions. And, kpc-3 users have a very special opportunity: KaWin Lite registration - half the price of full registration. Download the fully functional KaWin program from the KaWin home page (below) and check it out. 73,

I bought a Kenwood TH-79A(D) about a year ago, had it modified, and during the modification, the 'tech' (I won't flame him in public, but if anyone in the bay area wants to know who NOT to go to, reply via e-mail. His attitude after Kenwood stated the radio was fried due to the 'tech' doin the mod broke two traces was "You have me do a mod, you roll the dice. you gamble.:) Any way, Kenwood sent the radio back saying "Needs new control board." I called them back and asked how much it would cost. $175 for the board + $100 an hour labor, maybe 2-3 hours." So, $375-$475 for a $390 radio?? "Umm.. (pause) Yes.' So I asked about getting JUST the board. No. We have to do it. So I called the other service center, and they gave me a # for a parts center in California who could get the part, but needed a part #. So I called back the svc center, and asked for the part #. "We'd need to research it, and that would take time.. Check with the parts center." We went in circles for a few minutes, her saying we don't have time to research it, yata yata. And finally she put her manager on. Nice guy, he promptly gave me the part #. I then told him how my REAL tech (a friend of myne) thinks the part needs to be 'machined' in, not easily put in by hand. He said "No, it can be put in by hand, but if your friend's never done it before, it might be risky. I see here your radio is brand new.. Don't risk it, send it in, and we'll install it no charge, just for the cost of the board."

Now THAT is SERVICE. Long live Kenwood!

Hello!

A friend of mine who is traveling/working in Africa has requested my assistance. He has a Kenwood TS-50 radio and is trying to find a way to communicate with home - Seattle WA. He would like to be able to send E-mail from Zambia via the HF radio if possible. Is there any - fairly easy - way to accomplish this? He is not yet an expert in HAM radio. What kinf of equipment would be necessary? Could the TS-50 be used to accomplish this? Any comments or suggestions much appreciated!

Good point, Gary. I hadn't thought of that, but it makes a lot of
sense. Most of the systems I deal with have a resonant cavity load fed
with rigid coax where there is no chance of any rf currents on the
outside. (A good thing too, at 250 kW peak and 425 MHz.)

I couldn't agree more than this last line you wrote. IMHO, the
average price of equipment in ham business is way too high compared to
the that of computer stuffs in terms of value or what it can do. This
prohibits a lot of newcommers from going into this hobby. I , for
one, got a tech license and couldn't afford a 1200 baud modem and dual
band mobile radio yet. OTOH, I am connected to the world in Internet
through a $120 28.8K modem.

Assuming the receivers have a tuned RF stage, they should do well
up to 10-15 mHz for single conversion types, higher for dual conversion.
Since the receivers are working, I'd suggest checking the tubes
on a tester, then checking the voltages against the values indicated
in the Sams Photofact for that receiver.

Possibly a simple alignment is all that is needed to bring them
back to fairly decent operation.

Some restoration may be needed to get them operating to specifications.

Depending on what one values in a radio, a properly operating valve
radio would be a choice compared to current radios costing $100 to
maybe $500. There is something nice about a smooth tuning analog
dial that I haven't seen in any digital radio less than many hundreds
of dollars.

Try Hamtronics. They have little kits for what you want. Good stuff.

I would like to know if anyone knows of a radio that is in production or is to be produced that has many of the same features as the FT50R.
With ATRS, DTMF paging, Computer programming but has crossband repeating (perferably full duplex). The FT3000M comes real close but no banana (no dual band transmit)

1364. MFJ & Ten-Tec Regen Rcvrs : Opinions ?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-10-25 00:00:00 UTC
From: Rich Abbot <abbot@pez.bell-labs.com>
Message-ID: <3270BFF7.1A4@pez.bell-labs.com>
Source record: 192019

Howdy,

I'm looking for an inexpensive portable receiver for use as a "casual" 2nd rx -- something to sit next to my easy chair for monitoring 80, 40, and 20. I use a Sony 2001 for this purpose right now, and while it's a good sensitive unit, the pushbutton digital tuning is really annoying.

I notice that both MFJ and Ten-Tec sell competitive knob-tuned super-regens that will cover the freqs I want. Both about the same price; the MFJ can be had in kit or wired, while the Ten-Tec comes only in kit form.

Does anybody have experience with either of these units for monitoring the ham bands, as opposed to using them for SWL? If you've built the kits, how did it go?

Thanks and 73,

Rich

I'm looking for some information on some ideas for a 2 meter
antenna. My call is N3XZX. I basically recieved a homebrewed antenna from a
gentleman in Atlantic City. I liked the idea and tend to build a few
myself. It's just a plain old ground plain antenna, The one i recieved was
a quarter wave and i was wondering if there was any ideas and info for
making the same type but creating a 5/8 wave.
I heard for a 5/8 you need to have a top hat, is this true? Also any
info on whether this 5/8 is a good antenna comparing it to the quarter wave.
Any info would be greatly appreciated!
Thanks,
N3XZX
(Chris)

Please carbon copy responses to x32-viper_ck@juno.com so I don't miss
any good info

For hams? ...yes. Face it, leading edge USA products today are
aimed at all the emerging and now here personal communications areas.
Our best designers can earn much more in these fields!

The Japanese have innundated and saturated the ham market and
are now crying "no growth". This means no profits as they wish to
have them. <g> The easy pickings are over ...but they will again
catch up down the road. But, the Chinese will try, too.

Take care, recognize market value ...the US is THE world's largest
market for "leisure" products whether it be automobiles, ham gear or
household appliances, or anything else imaginable.

That is ...until we lose purchasing power in the new world market
still emerging. Keep watching over "your shoulder".

Optoelectronics makes the DC440 that decodes CTCSS, DCS, and DTMF. Visit them at http://www.optoelectronics.com/

Note: to decode CTCSS reliably, you will need to connect this device to the flat audio (discriminator) output of your radio, NOT the speaker output. The CTCSS tones are generally filtered from the speaker output.

Also, if you have a CTCSS decoder in your mobile radio, just enable it and rotate thru the selections until your receiver opens -- you've found what they transmit, and usually what you need to transmit. One of the mobile radio mfrs makes a radio with a button that'll do this automatically for you.

I'd hate to sound like well, an economist, but I think it's called economies of scale. I have been in computers since the late seventies and the price of equipment has come down dramatically as the market gets bigger and bigger (lower average cost of producing each unit, real important when a big chunk of the total cost is in research and setup).

With all that said, I still agree with you both. I have been out of ham radio for about 20 years and am thinking about coming back in. It seemed cheaper for me as a 15 year old with a newspaper route than as an adult with a decent job (as an economist). Prices have skyrocketed.

>through a $120 28.8K modem.

Well of course you can have a 1200 baud modem for $10. Just buy a
TCM3105 single chip modem and wire it up. Better hurry though, the
Bell 202 chips are going out of production fast.

One can sum up the reason for "high" amateur equipment prices in
one word, *volume*. According to a recent issue of Byte magazine,
there are approximately 35 million individuals in the US who own
PCs, and almost all of them want the fastest modem they can get.
Meanwhile, there are about 140,000 amateur radio operators who
operate digital modes, and most of them seem satisfied with their
old C64 and TNC1. What that means is that annual sales of 28.8 kb
telco modems is in the 5-7 million unit range while the annual
sales of TNCs is in the 5-10 thousand range. That factor of 1,000
in production volume makes a huge difference in retail pricing.

Amateur dealers sure aren't getting rich. Margins are about 7%
in amateur gear. Margins in consumer electronics are typically
closer to 50%. And the manufacturers aren't getting rich either.
The low unit volume means that they have to spread their overhead
over fewer units, and that drives up unit prices. For manufacturers
who cater exclusively to the amateur market, the low volume also
means they can't get the large volume price breaks from their
suppliers that makers of mass market items can get. This also
drives up prices, often dramatically.

The lesson which can be drawn from all of this is that if you want
equipment priced like computer equipment, you've got to get amateur
radio growing fast enough to bring the economies of scale to bear.
If the amateur market were buying equipment in sufficient quantity

to break the million unit a year barrier, prices would tumble sharply.

However, considering that amateur radio is a low volume specialty market, prices are still lower today than at any time in the past if you factor in inflation. In 1967, a good quality HF transceiver cost about $500 (the Galaxy V Mk II was $495). Accounting for inflation, that's $4,000 in 1996 dollarettes. Yet you can buy a good quality HF rig for about $1,000 today (DX70, TS50, IC706), and that's about 3,000 1996 dollarettes cheaper than in 1967.

Take home pay for the average worker in 1967 was about $120 a week. Today it is over $400 a week. So it cost about a month's wages to buy a HF transceiver in 1967, and it still does. But today's radio has lots more features. By contrast, a top of the line full size Chevy cost $3,400 in 1967. Today a Chevy Caprice costs around $30,000. In other words, the 1967 Chevy cost about 6 month's take home pay, but the new Chevy costs about a year and a half's take home pay today. And IMHO, the 67 Chevy was a better car.

Note well that take home pay hasn't kept pace with inflation, and that represents a huge hidden tax. There are other, somewhat less well hidden, taxes at work here as well. The Jack Daniels Distillery says a quart of Black Jack costs $0.25 plus tax (and cigarettes cost about $0.12 a pack plus tax). GM says that $30,000 Caprice actually costs $600 plus tax. The taxes are all taxes paid all the way back to extracting the raw materials out of the ground and passed forward until they reach the consumer. If there are many steps between the raw material and the consumer, the net taxation compounds rapidly (which is why US manufactured goods are no longer competitive, but our raw materials and agricultural products are, there are fewer steps where the government can get its hand in the till in the latter).

Only individuals pay taxes, corporations merely collect taxes for the government, passing the expense on to the consumer in the form of higher prices (which are nothing but hidden taxes). Think about that the next time a politician says he wants to give you a break by "soaking the rich corporations". He's lying. Of course that should be obvious because his lips are moving. (BTW this is a good reason why we should go to a direct national sales tax. That way the hidden taxes would become visible to those who ultimately pay all taxes, and would show them just how badly they are being raped by the government when they go into the auto showroom to buy that $600 car and find out there's $29,400 in sales taxes tacked onto it.)

[talking about old radios]
>Possibly a simple alignment is all that is needed to bring them
>back to fairly decent operation.

Or more likely not. Radios seldom go out of alignment. The tendency
to diddle the alignment should be resisted unless you know for sure
that someone has been in there diddling it earlier. If the radio
appears to have subpar performance, it is almost certainly because a
component has changed value (often an electrolytic or paper capacitor
or a screen resistor) or a tube has lost emission. The correct repair
is to replace the faulty component. Trimmer capacitors and slug tuned
coils don't usually change value unless someone has been in there
diddling them. If someone has, then that can mask the real problem
and make servicing the radio correctly much harder than necessary.

1399. Re: Importance of coax length on HF A myth?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-10-26 00:00:00 UTC
From: "Merv Stump"
Message-ID: <54u44m$1k8@mtinsc01-mgt.ops.worldnet.att.net>
Source record: 192039
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc

ARRL currently has a program under development which analyzes transmission line. I'm fortunate to have been asked to play with an early copy. Running some quick examples shows the following:

At 28 MHz an antenna with a purely resistive load of 50 ohms fed with 100 feet of RG213 has a loss of 1.181 dB. There is no additional loss due to SWR.

The same antenna fed with 100 feed of 1/2 inch 75 ohm hard line has a loss of .420 dB due to the cable and an additional .032 dB due to the SWR for a total loss of .452 dB.

An antenna with a purely resistive load of 500 ohms (10/1 SWR) fed with RG213 has a loss of 1.181 due to the cable and an additional 2.702 dB due to the SWR for a total loss of 3.883 dB.

The same antenna fed with 1/2 inch 75 ohm hard line has a loss of .420 DB due to the cable and an additional .032 dB due to SWR for a total loss of 452 dB.

Incidentally, I chose purely resistive loads just to simplify things. The program works with complex loads as well. If anyone would like a specific calculation you can eMail me. All that is needed is the type cable, the length of the cable, the frequency and the load, (resistive and inductive).

Regards, Merv

IMO, this is one of the biggest (if not THE biggest) problem in
Amateur Radio today. The service will die without a large influx of
young people comming in. BUT, as you said, they aren't going to be too
enthused with the oxcart speed of packet radio or the prospect of
spending time learning to be 19th century telegraph operators.

73,
Butch N2YMJ

I agree with your comment on common mode currents. Also, with your
comment about the directional coupler. What it really amounts to is
that if the coupler has poor directivity (equivalent to not being
balanced for the impedance of the cable being used), some of the
forward wave is coupled into the reflected port. The resultant
apparent reflected signal depends on the relative phases of the
forward and reflected power and thus on the position of the coupler in
the standing wave. This phenomenon can also make the VSWR look better
than it really is if the two waves tend to cancel.

This discussion is a good example of the Internet at work. It's nice
to see that the ham radio newsgroup generally seems to be populated by
considerate people and not the nutcakes that wase bandwidth on a
couple of other newsgroups I follow.

altavoz: 9913 !!! on 30 MHZ NOT !! RG8FOAM
You'll see a .7 db/100' to .9db/100' increase in attenuation
going to RG8foam . WOW , BIG LOSS (NOT)
Stick to radiation pattern adjustments , not splitting hairs
over coax.
Read "amatuer radio vert' antenna handbook" By CAPT Paul H.Lee
deceased (N6PL) . Its the greatest.

>impedances at different points aliong the coax and you will get a
>different SWR with a 50 ohm source, depending on where you feed the
>coax. So your friend is correct if the load is not m,atched
>accurately.

No, the SWR is constant, and is a function of the mismatch at the load end only. That constant SWR is what causes the presented impedance variation along the line (due to transmission line transformer action). If you insert the SWR meter anywhere along the line, it will read the same SWR (discounting line loss). A SWR meter reads SWR, not impedance.

Internally, a SWR meter is a 50 ohm line section, so it merely acts as a short extension to the cable being measured. (If you try to measure 75 ohm line with a 50 ohm SWR meter, however, you'll be in for some surprises.)

Conversely, if you have an operating impedance bridge, you can measure the impedance at any point along the line, and given that, the cable length from the load to that point, and a Smith Chart, you can determine the SWR on the line (discounting line loss).

Now if the line has loss, and all real lines do, then you have to add a fourth variable, and the system becomes more complex. Instead of a constant SWR circle on the Smith Chart, now you have to follow a SWR spiral which approaches 1:1 as cable length tends toward infinity. The approach is asymptotic, and if cable loss is high, will quickly approach 1:1, but never quite reaches 1:1. If loss is low, the approach will be very gradual, and for moderate line lengths can be assumed to be a constant SWR circle.

(Incidently, this is a convienent way to measure line loss, just place a short or open at the load end of the cable and read the SWR at the source end, the closer to 1:1 it is, the higher the cable loss. There's a formula in the Handbook which will give you the exact loss in db for a given SWR and line length.)

For moderate lengths of good cable at HF (good cable, not RG-58), cable loss can be discounted and the SWR circle can be assumed nearly constant. At VHF+ however, even with good cables loss may become significant when the length exceeds several wavelengths and must be considered when analyzing line behavior.

This means that a low SWR is not necessarily a good thing. It can indicate a lossy system rather than indicating a good match. One way to differentiate is to look at the SWR curve over a band of frequencies. If it is broad and flat, the cable is probably lossy (or you have a dummy load for a termination). Real antennas are typically only close to design impedance over a narrow frequency range (typically less than 5% around the design frequency), so the SWR curve should quickly rise as it moves away from the center frequency of that range. Anyone who says he has a broad flat SWR is probably really telling you he has a pretty good dummy load for an antenna system.

(Note there are exceptions, antennas such as discones and log periodics present a near constant impedance over a large frequency excursion. But in general a low antenna system Q is indicative of low efficiency and high loss, IE the behavior of a dummy load.)

> I heard for a 5/8 you need to have a top hat, is this true? Also any
> info on whether this 5/8 is a good antenna comparing it to the quarter waveN3XZX Chris

altavoz: No hat required for 5/8 w. A 5/8w is much better for vert'
omni directional than 1/4w . Same coil for 1/4w but tapped a little
different . Radials must be 180 degrees, straight down, with
"wiskers" (going down 1/4w from feed point, some 1/4w radials at
45 degree angle...they form a cone).
A hat on 5/8 w will effect the pattern , try it.
For more gain, put a hairpin (<1/4w shorted stub) on top of 5/8 then
another 5/8w vert on top of that . Or the whole ant' a 5/4w and a
colinear stub pointing down (open end down , at the 5/8 w point)
Coax up thru "tube" Radial system.

I agree with you Butch. And ham radio retailers probably run a very narrow
profit margin. The problems I see is that we need to promote amateur
radio, especially to young people. Hard to convince them with 1200 baud
packet (with 300 baud through put if you're lucky) compared to 28.8k
Internet access. Also hard to convince them that they need to learn the
code to communicate around the world.

>
> Steve KT4FY

altavoz: No, a 50 ohm ant' feeding a 75ohm coax will
cause a SWR into coax and towards the radio and an exact
length of coax will not reduce the SWR except as
attenuation factor over that length.

This is definitely true ... last spring, when I was contemplating changing jobs, I actively sought out ham radio companies ... Ten-Tec, the only significant US manufacturer of RADIOS for hams (as opposed to the myriad of accessory companies) admitted that they could not come close to a "normal" salary I could easily get in "real world" industry.

I want to make it *clear* that I think Ten-Tec is a fine company, or I would not have even considered seeking employment there ... they're simply caught in the situation where their product is competing with off-shore production with cheap labor and government support (Japan, Inc.)

I ended up with a much larger company which builds consumer-oriented communications equipment (both wired and wireless) at a salary +bonus +benefits of over 2X what Ten-Tec said would be "the most they could possibly offer to anyone."

altavoz: You dont need to cut in 1/2 wave multiples
since it wont change the SWR except thru a very small
increase due to decreasing attenuation over length.
H.F. has very low attenuation on RG8

>make or price bracket?

Those figures are respectable. What they are telling you is that for 20 db of quieting, a 3 kHz deviation signal needs to be 0.6 uV in the frequency range of interest. Amateur gear is usually specified at the 12 db quieting level instead, so sensitivity figures look better, but anything near half a microvolt is a good number for 20 db quieting.

With no signal, you get noise output from the receiver (open the squelch between stations and listen). When a signal is present, what matters is the ratio of recovered audio to recovered noise audio. This is called SNR (Signal to Noise Ratio). Due to the FM threshold effect, SNR will be better than the carrier to noise ratio (for AM, SSB, or CW, CNR = SNR, but that's not true for FM above the threshold, it will do better). So sensitivity figures for FM receivers are specified at a certain level of "quieting", IE even an unmodulated FM carrier will suppress the noise. This amount of quieting is measured in db. 20 db is considered "full quieting" in FM communications work, IE the noise remaining negligibly affects intelligibility (20 db means the noise is 100 times weaker than the signal).

Sensitivity is measured in terms of the signal voltage appearing across the input impedance of the receiver. Traditionally that's 50 ohms. So the specification is telling you that you need 0.6 microvolts of signal at the receiver input to achieve the 20 db quieting level. That's pretty good, the typical FM broadcast receiver needs 2 uV or more for the same performance. Amateur equipment will typically specify something on the order of 0.2 uV as the sensitivity figure, but that will be for 12 db quieting, not for 20 db (12 db means the noise is only 16 times less than the signal).

A very important specification is missing, however. That's the
third order intercept point. To a large degree, that determines
how much "crud", IE undesired mixing products from strong nearby
signals, that will contaminate your desired signal. Also, there
is no specification for image response. These two factors are
important, usually more important than sensitivity, in determining
if a receiver is suitable. Many scanners suffer badly in both
departments due to their necessarily wide frequency range, and
manufacturers are often reluctant to put hard numbers to these
performance aspects of their equipment. About the only realistic
test you can do is to take the candidate receiver to your local
intermod alley and see how bad it is.

>Listening to VHF/UHF transmissions, the audio quality is not high, not as
>good as commercial broadcast FM. Is this due to bandwidth? Using Xandi
>Electronics' miniature crystal-controlled transmitter (143.775MHz) to
>transmit conversation to the scanner, the end result is not as clear as
>it could be. Would a different transmitter/scanner combination give
>better clarity, or would a different technology be necessary for improved
>fidelity?

Broadcast FM uses 75 kHz deviation while communications equipment
uses only 5 kHz deviation. This means that audio frequencies higher
than 5 kHz will have a modulation index less than 1, and will be
rather noisy in the communications radio, IE they lose the benefit
of the FM threshold effect. Thus the audio section of the radio is
typically tailored to roll off response at about 3 kHz. With FM
broadcast, the modulation index will still be 5 for 15 kHz audio,
so high frequency response is considerably improved by the large
value of deviation.

A Grade A coverage area FM broadcast signal offers 40 to 60 db of
quieting (60 db means the audio signal will be a million times
stronger than the noise) while a communications channel is satisfied
with 20 db (signal audio only 100 times stronger than the noise).
Frequency response and SNR of broadcast signals will thus typically
be significantly better than communications FM. But the cost paid
for that is much higher power levels required for transmission,
much higher signal levels required for receive, and much greater
spectral bandwidth consumed.

In addition, communcations equipment has its audio response tailored
for best intelligibility, not for best fidelity. The audio frequency
response is typically 300 to 3,000 Hz instead of the 20 to 15,000 Hz
of FM broadcast, and communications receivers are typically specified
for a THD (Total Harmonic Distortion) of 10%, which is gross by HiFi
standards. This is a major difference in fidelity. And of course
dynamic range is constrained by the SNR to a lesser value for typical
communications radio signal levels compared to typical broadcast signal
levels. A scanner is not a HiFi.

Still, if signal levels are strong, and you rework the audio
sections of the communications radio for better fidelity, you

can get quite good results with NBFM.

>attenuation factor over that length.

You two are talking about different things. Sure, the SWR on
the cable will not be unity, but if you cut the cable to an
electrical halfwave (or multiple), you *don't care* because
the impedance seen by the source is a repetition of the
impedance presented by the load. The source doesn't care
about SWR on the cable, it only cares that it sees the
correct impedance presented to it.

In the case of a 100 ohm load and a 50 ohm source, an electrical
1/4-wave of 75 ohm cable will transform the load impedance to
50 ohms at the source end of the cable. The source will be happy,
the load will be happy, and we'll be real happy there is SWR on
the cable, because it is this SWR which makes the transformation
happen. A "high" SWR isn't always bad, in fact it can be downright
useful at times.

1436. New Astron Power Supplies

Newsgroup: rec.radio.amateur.equipment
Date: 1996-10-27 00:00:00 UTC
From: Thomas Brockdorf <tbrock@execpc.com>
Message-ID: <54v0g2$dmo@newsops.execpc.com>
Source record: 191876

Astron has a couple of new switching supplies.
One is good for 20 amps continuous, 25 amps intermittant. The other is
25 amp continuous, and I think 35 intermittant. $129.95 and $149.95.
I have not seen these advertized yet.
I went to A.E.S. yesterday to buy an antenna, and ended up buying the 20
amp model. It is about the same size as my Icom 706. It is very light,
and would make a nice supply for portable opperation.
Has a thermostatically controlled fan on the back.
I put my radio on a dummy load at 100 watts, and it took probably a
minute befor the fan came on. The fan is very quiet, and the supply did
not feel very warm to the touch.
Very nice unit!

>Regards, Merv
>
I've had a couple of requests for examples directly addressing the length
of coax question:

At 28 MHz an antenna with an impedance of 70R +4J fed with 11.597 feet of
RG213(1/2 wave length at 28 MHz) has an impedance at the input of 69.28R
+3.76J. Virtually identical to the load, but even a halfwave of cable
does have some transforming characteristics due to it's loses. TLA
computes the SWR at load as 1.41/1 and at the input as 1.40/1.

The same antenna fed with 5.798 feet of RG213 (1/4 wave length at 28MHz)
has an impedance at the load of 35.77R -2.35J. An obvious transformation
of the impedance, however, the SWR is still 1.41/1.

If you feed the antenna with 1/2 wave of PERFECT COAX,(NO LOSSES) TLA
computes the impedance at input as 70.02R + 3.79J (The difference between

this and 70R and 4J can be attributed to rounding.)

Regards, Merv

1444. Yaesu FT-50R versus Yeasu Vertex VX-10

Newsgroup: rec.radio.amateur.equipment
Date: 1996-10-27 00:00:00 UTC

I have only got round to having a quick check of my 1000mp, and
surprisingly found that my carrier was on 24.977, well within the
Amateur band.
This makes the second harmonic at 49.954, I can hear it clearly
on a baby listening device anywhere in the house. It is also not a good
idea to listen to classic fm around 100mhz when in the shack :-)

At least my six metres is clear !

You are correct that the standard mike makes things worse in the shack,
and anything else connected to the rig seems to help radiate the
carrier. I use a homemade headset, and its not as bad as the standard
mike, though changing the position and polarity of any connected cables

makes a differance.

Its a pity about this, I love the rig and wouldn't change it, but would like to know how anyone gets on with Yaesu, mines still under warranty so I suppose they should fix it.

I have bought, traded and sold numerous rigs over the past several years Kenwood, Yaesu, Ten-Tec, Icom and JRC and overall consider this my favorite radio of the group. I like the layout of the radio (position and location of the knobs buttons), the looks, the 200 watt output, automatic notch, solid tight receiver (very very important) and simply the way it operates. I have recently used a Ten-Tec Omni 6, Japan Radio Jrc-245, Kenwood TS-870, ICOM 781 and Yaesu 1000MP and perfer the 775DSP over all the above mentioned rigs and yes there are some functions I maybe like on the other rigs; However this one I want to take home to MOMMA. You hear people talk about DSP and all the settings one has over the other or how much easier ones DSP settings are to set vs. the other but once you get tired of playing with the new TOY (dsp) and you have the settings to your liking you should not have to reset them often or again. The only disadvantage I see over the 1000MP or the TS-870 is price and the ability to operate with a battery.

From: tsarah@gwis.com
Message-ID: <55011p$c2f@gwis.com>
Source record: 191893

Don't know if this is the correct place for a question of this nature
or not, but here goes.

I'm planning on mounting 3 antennas on one pole.

top: 2m/70m verticle
mid: 2m quad or verticle pol. beam
bot: 6m 3 element horzontial pol. beam

Now, the question. What is the minimum spacing between each of these
antennas?

I have looked thru the ARRL Antenna book and couldn't find anything,
also the ARRL Operations book.

Source record: 191898

I cannot say I agree with the remark that prices for hamgear have
skyrocketed.

Anyone that writes this doesn't know what almost identical equipment for
the professional market costs.

I have collected lots of professional stuff, from SITOR units to
transceivers, and I am stunned to see time-and-again how a $2000 Japanese
transceiver can outperform a professional transceiver in every aspect.

Also, a cheap PK232 on Amtor (=SITOR) turns out to work about 300% better
than a professional SITOR couterpart, not just in terms of the user
interface, but mostly in terms of sensitivity and bit-error-rate.

It is a mystery to me how the remaining manufacturers of HAM equipment can
come up with such good, and relatively inexpensive equipment for such a
small market segment that the HAM market obviously is.

Most US communication equipment manufacturers have dropped-out of the ham
market for that reason some years ago (why produce a transceiver for the
ham market for about $2000 while the same transceiver with a different
front panel sells for at least 4 times more as a marine radio)

My simple FT990 transceiver outperforms all professional transceivers that
I have here, and it is not even a top-of-the-line radio.
This FT990 is built with modular glass-epoxy plug-in cards on a
motherboard, just like professional equipment. Even has a direct-digital
synthesizer.
And you can get this radio for less than $2000 if you shop around.
Unbelievable how they can make it for that money.

Not to talk about new digital modes like PACTORII and Clover. These modes
are so good that even the professional user market segment is considering
to use these modes, which means it is placed it in a more professional
looking 19" rack and sell it for 10 times as much.

HAM equipment expensive nowadays? NONSENSE! Has never been cheaper!

(No, I am NOT a dealer. Just a radio ham that appreciates nice equipment)

1464. GMRS PRS-102 & FRS

Newsgroup: rec.radio.amateur.equipment
Date: 1996-10-27 00:00:00 UTC
From: qrzed@earthlink.net
Message-ID: <550djn$1ak@ecuador.earthlink.net>
Source record: 191904

Hello Bill:

I just bought 2 PRS-102s myself.

First a slight correction...the (7) "interstitial" 462 fqs -and- 462.575 / 462.625 / 462.675 are pre-installed in the radio. There are no DIP switches to change these fqs to the other (5) "regular" 462 GMRS fqs or the 467 fqs. Of course, there is no repeater offset. The "always on" pre-set squelch is a pain too as is the lack of an external power jack.

Nice carrying cases, spare batteries & basechargers were ordered as options which arrived in 6 days. A CTCSS add-on chip is also available for $49.

There are cheaper radios w/more features but I chose the PRS-102 because of its unobtrusive size & solid Motorola construction. I also feared that these radios would disappear from RS shelves if people bought them to use (illegally) as "super FRS radios." (same fqs: 2 watts GMRS Vs. 1/2 watt FRS, external ant usable w/connector Vs. unremovable ant on FRS).

I'm waiting for my GMRS license and haven't talked (REALLY!) so cant' give you a user report. I'm very interested in hearing your comments though.

un-ID's Spanish & Arabis simplex conversations are being hrd on GMRS fqs here in Los Angeles. Can anyone tell me positively if FRS radios are on the street yet or are these guys all bootleggers.

FYI: IT took me a month to track down a copy of GMRS rules: 47CFR Part 95, sub.A. As far as I know, this is only available as part of a 858 pg Code of Fed Regs book for $30. I'll be happy to send a free photocopy of the GMRS pages to anyone who sends me a business size envelope w/ 2 stamps: Ken Kashiwabara, P.O. Box 486, Reseda CA 91337.

Ken

> Hi Joel, got to nitpick a tad.
>
> 1. 100ft of RG-58 on 440MHz with an SWR of 1:1 and *no feedline radiation*
> does make a difference.

altavoz: I get 271 "1/4 wavelengths" and that makes it an ODD multiple
of 1/4w and therefore it will radiate cause the open end of the coax
will see a short on the outside end of the coax at the radio end.
.66 VF RG58 , assuming a high SWR at load and 1:1 at radio.

> 2. 100ft of RG-58 on 28MHz with an SWR of 20:1 and *no feedline radiation*
> does make a difference.

altavoz: The diff we're talking of is trimming the line and in your
case trimming the line will increase the RF (feedline radiation)
on the outside of the coax By pulling down the Z seen on the outside
by the antenna . Trimming 1/4w will peak the FEEDLINE RADIATION.

I noted a row of 6 solder pads, just above jumpers 1 2 and 3 (remove 1 for mars/cap). On my "new version" radio I found black resisters in positions 1 thru 5.
The resister in pos 1 had been soldered in after production.
I removed that resister. After reset and expanded rx functions were entered.
the radio now displayed freqs between 76mhz~200mhz 300mhz~400mhz 400mhz~540mhz 590mhz~1000mhz, less cells! ADMS-1c mod "yank the prog cable" didn't do its magic. I also triied moving res 1 to pos 6. No luck, it reduced rx coverage, and no tx out of ham bands. Removing res 2 didn,t help.
Maby one of you guys that have the older version radio could remove your key pad and look at the resisters above jumpers 1 2 3. my radio also has a black resister below jumper 2 (mars/cap) just right of the three leg diode marked K. And to the right of jumper 3.

Hello Bill:

I just picked up 2 of these radios myself.

First a slight correction...The (7) 462 interstitial frequencies plus 462.575 / 462.625 / 462.657 are included. There are no DIP switches to program the other (5) regular 462 channels. Neither the 467 channels nor repeater offsets are available either. I bought carrying cases, spare batteries and base-chargers as special-order options that arrived in only 6 days. (CTCSS is a $49. option that I didn't buy)

The "always-on" non adjustable squelch is also a pain as is the lack of an external power jack.

There are cheaper, more feature-filled radios but I chose the PRS-102 because of the unobstrusive size & solid Motorola construction. Also I feared that these radios would disappear from RS shelves as people bought them to use (illegally) on the new Family Radio Service (same fqs, 2 watts instead of FRS 1/2 watt, external ant usable w/special onnector.)

I'm waiting for my GMRS license and haven't talked yet (REALLY!) so can't give you a user report. I'd be interested in hearing about your results.

Lots of Spanish & Arabic conversations w/no IDs have recently started to appear on the GMRS/FRS frequencies here in Los Angeles. Can anyone confirm if FRS radios are actually BEING SOLD & IN USE? Or are all the people I'm hearing all bootleggers?

Tnx, good luck w/your radios...Ken

>> after all, there's a 220 ham band there...

I looked at a friends FT-50 after he made his "full receive mod". While
the radio did tune to 220, it was deaf. It could hear my HT across the room,
but it could not hear any of the 220 repeaters on our area. The radio,
at least in our area, would have been useless as a 220 receiver, given its
poor sensitivity.

Hello Bill:

I just picked up 2 of these radios myself.

First a slight correction...The (7) 462 interstitial frequencies plus 462.575 / 462.625 / 462.657 are included. There are no DIP switches to program the other (5) regular 462 channels. Neither the 467 channels nor repeater offsets are available either. I bought carrying cases, spare batteries and base-chargers as special-order options that arrived in only 6 days. (CTCSS is a $49. option that I didn't buy)

The "always-on" non adjustable squelch is also a pain as is the lack of an external power jack.

There are cheaper, more feature-filled radios but I chose the PRS-102 because of the unobstrusive size & solid Motorola construction. Also I feared that these radios would disappear from RS shelves as people bought them to use (illegally) on the new Family Radio Service (same fqs, 2 watts instead of FRS 1/2 watt, external ant usable w/special onnector.)

I'm looking for a part number for the small metal "spring" located on the bottom of a Uniden BC-100XLT handheld scanner that puts pressure on the battery pack to keep it in place. This is the same part as on the BC-200XLT as well.

Anyone with a part number, and a phone number for Uniden parts would be most helpful as I attempt to repair this scanner.

1484. Re: Looking for MFJ Hi Q Loop antenna

Newsgroup: rec.radio.amateur.equipment
Date: 1996-10-27 00:00:00 UTC
From: Loek d'Hont <ldhont@ti.com>
Message-ID: <01bbc39b$1a2ca020$5fc1759c@A0927429.itg.ti.com>
Source record: 192069
Cross-posted to: rec.radio.amateur.equipment,rec.radio.swap

I have bought this MFJ antenna a while ago, and although it does the job, the mechanical construction is not great. I also had to change the size of the internal coupling loop (larger) to get a proper VSWR over the band. The manual doesn't mention this at all.
It also has quite a lot of backlash in the gearings. It is difficult to tune (although not impossible)
Another problem that I had is that a spider ended up between the variable capacitor plates, because the plastic case isn't sealed. So when I started to transmit, the spider got toasted, creating a "carbon short" between the plates. I had to remove the antenna from the roof to fix this problem.
On photos that I have seen, the ISOLOOP looks more sealed, so I would expect it to be better for this aspect as well.

If I would have to do it all over again, I would now buy the ISALOOP from AEA.
Cost about $150 more but it has a stepper motor with almost zero backlash, and is built much more rigid and there is a provision to change the coupling between the main loop and the input loop during the installation, for optimal VSWR.

So you might want to ask for a used ISOLOOP instead, I have seen some people offering them in the past for very decent prices.
there is also an optional fully automatic tuner available for the ISOLOOP.
The MFJ loop you can get with an optional semi-automatic tuner (I have that option) but because of the backlash in the gearings you will have to manually finetune it after it found the coarse settings.

I have to be complete in my advice though; if you accept all the deficiencies that the MFJ loop has, like I described them above, the electrical antenna performance for the MFJ loop won't be different from the AEA ISOLOOP.

Cell phones seem to be too much trouble to do much with as they are microprocessor controlled, synthesized, and most of the RF circuits are rather narrowly tuned.

> Also think somewhere I still have a Motorola VHF IMTS phone which if I
can
> take it down to two meters could make a nice packet tranceiver... Also I

> think I can get my hands on a Harris VHF IMTS phone for the same purpose.

I presume the Motorola is a Pulsar model? I remember hearing of someone who converted one of those into a REPEATER by retuning the duplexer, modifying the PLLs and by replacing the supervisory board with a premade repeater controller. Since the manuals for these phones were (are?) available the task was possible within a reasonable amount of time. The Pulsars had decent receivers and transmitters, but stay away from the older IMTS phones (the ones with the huge discrete component supervisory board that swings up for service) as their transmitters were prone to failure if the SWR got out of hand (like ice on the antenna).

Good luck!

PS, the duplexers can be a pain to retune.

...Peter

Take a few minutes and read this. It could change your life!!!!

This is your chance to earn BIG BUCKS

This is for real....no gimmicks!!!

I read this article from a news group telling me I could make $50,000.00 in
as little as a month from an investment of only $5.
It sounds like a scam but it is legitimate. If you doubt it check out
Title 18 section 1302 of the U.S. Postal service and regulations.
It is --NOT--ILLEGAL--IT IS NOT A --CHAIN LETTER--IT IS TOTALLY
LEGITIMATE!!!!!!!!!
I decided that an investment of only $5.00, 5 envelopes and 5 first class
stamps was not going to break me even if I didn't receive any money back.
I can't guarantee that you will make money, who can, but the chances that
you won't are extremely small.

So here it is.....The procedure is simple

First.

Write your name and address on five separate sheets of paper.
Next write "Please add me to your mailing list" on each piece of paper.
Fold a ONE DOLLAR BILL in each piece of paper and mail one to each of the 5
following addresses:

---

1. ERIC FINCH, P.O. BOX 245 LUFKIN, TX 75901

2. KIP GRIFFIN, 349 W. WEBSTER, MUSKEGON, MI 49440

3. PETER SIMMONS, 668 CLAY #118, SAN FRANCISCO, CA 94111

4. JOE D'BELLA, 4611 TWISTED OAKS DRIVE #1916, RALEIGH, NC 27612

5. CONRAD DERY, 817 N. WASHINGTON ST., VAN WERT, OH 45891

Second

Remove the first name on the list and move the other four people up. For
example (5 becomes 4, 4 becomes 3,) etc....
Put your name and address as number 5
You can do this by re-typing this article or edit it and re-post it.

Third

Post your amended article to at least 200 news groups. This may seem like
a lot but it is easy to post to more than one at a time and there are over
17,000 different news groups so there is no shortage of space to post. The
more news groups the better your chances of being seen.

CONGRATULATIONS!!!!!!!!!!

You are now in the mail order investment business.
You will start to see results within 7 to 14 days
Remember, the more news groups you post to, the bigger your return will be.
You may want to get a post office box to handle all of your mail.
If you wish to remain anonymous you can use a pseudonym such as "The
Manager" or "The Investor", but be sure your address is correct!!!

How and Why the system works.

Out of every 200 postings you make you receive an average of 5 replies,
each with a dollar bill enclosed. Yes only 5, as an average.
It looks small at first but when you analyze it you see the beauty of your
investment.
With 200 postings you make $5.00 with your name at number 5
Each person who sent you $1.00 now makes at least 200 postings with your
name at number 4.
You have made $50.00
Your 50 new agents make 200 postings each with your name at number 3.
Now there have been a total of 10,000 postings. The average return is 500
at $1.00 each is $500.00
They make 200 postings each with your name at number 2.
Now there are 100,000 postings with your name on them.
Now expect 5,000 returns at $1.00 each...WOW $5,000.00
Finally 5,000 people make 200 postings with your name at number 1
You get a --$50,000-- return before your name drops off the list.
AND THATS IF EVERYONE ON THE LIST MAKES ONLY 200 POSTINGS!!!
Total possible income in one cycle = $55,555.00

From time to time, when your name drops off the list, you take the latest
posting that appears in a newsgroup and simply add your name and another $5
and your back in.

Remember 200 postings is only a guideline
The more you post, the more you receive

REVIEW

The cost to you--$5.00 + 5 stamps + 5 envelopes

There are millions of internet users and hundreds of thousands of new
customers every month which gives you millions of prospective agents.

17,000 + newsgroups to post your article to.

Read the instructions carefully and act fairly
That is the only way the system will work properly
Keep a list of everyone that sends you money and monitor the newsgroups to make sure everyone is being fair
Print this out and refer back to it in the future.

Get ready to make the easiest money you have ever earned!!!!

1498. Standard 5718DA (Cell Mod ??)

Hello,
Anyone know of a Mod to open up cellular band on the Standard
5718. I've already done the MARS/CAP mod and that worked fine. Funny
thing is that not only is the cell portion blocked but some of the
public service stuff also below 869.010 MHz also can't be entered into
the VFO. Oh, and one other thing... Have any of you had to send your
original purchase radio back for a swap. I did and was very pleased
with the way they handled the situation.

73, -Jim- (kd1oq)

Source record: 191844

I have been using one for almost a year. No complaints, it works
excellent in my mobile. Alinco only supplies a five foot remote cable for
the control head and does not recommend extending this, so consider this
if you wish to remote mount the control head from the radio. I purchased
two cables and connected them together with jumpers and have not had any
problems, but as I said, Alinco does not recommend it. Hope this helps.

Message-ID: <E00Cxr.5x4@eskimo.com>
Source record: 191849

: I looked at a friends FT-50 after he made his "full receive mod". While
: the radio did tune to 220, it was deaf. It could hear my HT across the room,
: but it could not hear any of the 220 repeaters on our area. The radio,
: at least in our area, would have been useless as a 220 receiver, given its
: poor sensitivity.
: N0FPZ

Well, at least mine was able to receive TV channels 11 and 13
audio which are active here in seattle. That wouldn't be possible without
the mod. Also, TV audio bandwidth is a good reason for Yaesu NOT
to widen the WIDE FM IF bandwidth.

1511. Hallicrafters FPM-200 Owners Directory

Newsgroup: rec.radio.amateur.equipment
Date: 1996-10-28 00:00:00 UTC
From: Jim Garland W8ZR <4CX250B@miavx1.muohio.edu>
Message-ID: <3274D3FB.4594@miavx1.muohio.edu>
Source record: 191850
Cross-posted to: rec.radio.amateur.equipment,rec.,radio.amateur.,homebrew,rec.radio.amateur.misc

I'm trying to put together a directory of all Hallicrafters FPM-200 owners, and woujld appreciate your letting me know if you own one, or know of somebody who does. I believe there are probably not more than a couple of dozen in existence.

For those of you who may not be familiar with the rig, the FPM-200 is perhaps the rarest and most unusual ham transceiver ever built. Built in 1959, it is no relation to the FPM-300, which followed it fifteen years later. The FPM-200 was all solid state (germanium bipolar transistors), except for the finals (6146s) and driver, covered 80m-10m with 100 watts of ssb,am and cw, had twin PTOs with linear 1KHz readout, no tuning, used glass-epoxy circuit boards and mil-spec construction, switching power supply, and was smaller than a typical speaker cabinet. It sold for about $2600 in 1959 dollars -- about the same price as a brand new KWS-1 and 75A-4. Technologically, the FPM-200 was at least a decade ahead of its time. The rig was marketed heavily in 1960 but never really made it to full production. My best guess is that about 25 were made, but nobody seems to know for sure.

If you know anything about the history of this rig, have any brochures, etc., please let me know. If you own one, I'd like to collect some or all of the following information:

1. Serial Number (if any --some apparently didn't have one):

2. Accessories available: (It was supplied with a.c. pwr supply/speaker, mobile mount, chrome lock for mount), two manuals.

3. Condition: (cosmetic and operational, any modifications)

4. Known history of your FPM-200 (previous owners, etc.)

5. name, phone number, address, email address, call sign of owner.

I'll obviously make the information I receive available to all.

Thanks,

Jim W8ZR

>
> What about hardware mods?

I had the same question not long ago and got this answer - and it works:

----------snip----------

Ok, after messing around with the radio on my own and then getting the
"official" mod, here's a summary of the various diode mods for the Z1A:

Icom Z1A mods

[B]+[#]+[POWER] = Extended Receive.
VFO *DISPLAYS* 50-299.900 and 300-999.900.
AM Aircraft band enabled.
SET mode now has a new "PLACE" function for setting
the direct entry starting digit.

There is room for four diodes in the Z1A located on the CPU board to the
left
of the ribbon cable connector. On a US version, only the bottom two are
installed. D15 is just below and to the right of the four diodes.
These
diodes are bigger than the rest of the surface mounted components and
are easy
to spot.
The official ICOM mod (which I unofficially saw...) is to remove D15 for
extended TX and to use the above keyboard mod for extended receive.
According
to the sheet, the 800-900 band is NOT available in US versions.

+-+ +-+
| | | | <---- Installing diodes in either of these seems to do
+-+ +-+ nothing.

+-+ +-+
| | | | <---- IN: US Version 144-148 TX 440-450 TX
+-+ +-+ OUT: Extended 136-174 TX 380-470 TX (Lose
auto-repeater
^ and tone
encode)

```
|
+------------ IN: US 144-148 TX 440-450 TX
OUT: European 144-148 TX 430-440 TX

+-+
"D15"--> | | <---- IN: US Version Stock
+-+ OUT: Extended TX 136-174 380-470 (keeps
auto-repeater
and tone
encode)
```

A word of warning about messing with the four diode pads: If you detach either one of the installed diodes, the CPU will reset and you'll lose ALL of your memories. (found that out the hard way...) D15 doesn't seem to affect the memories at all.

Since the 800MHz band is not available in US versions, my guess is that there's a keyboard mod to unlock it instead of a diode. The diodes only seem to control the country versions. If anyone has any more keyboard mods, please post them.

----------snip----------

I hope I could help all the users mni 73`s es 55

Why would you want encryption capability?? As far as I remember, you
cannot use encryption on ham frequencies.

Joe

Wrong O buddy boy.

An electrical 1/2 of coax is a tried and true method of mesuring
the SWR at the antenna feed point remotely for exactly that reason.
Its totally invisible to the remote test gear. If you doubt it try it!

>
> 73, Cecil, W6RCA, OOTC (not speaking for my employer)

altavoz: You're assuming a choke . The thread makes more sense
if you dont assume a choke (i went all the way back to JOEL
GAMBLEs post)

I think he's saying a 440 signal into RG58 is a 1:1 NO MATTER
WHAT cause it's 100 feet long and that means it could be an
open circuit . I think he tried to get one past us by making
us assume that there was a termination .
Anyway the way to kill it is BALUN,steel wool, ferrite,
cut coax to a particular length (narrow BW), or offset feed
the antenna (bal ant has an unbal' point where you can hook
coax, and pattern does not suffer).
What i find amasing is so many novices worry about the
match , but not the radiation pattern . You can match
anything, even a 1/2w by stretching it a little to bring
down the R and that 2nd lobe is too small to hurt .
Radiation pattern on a J pole is bad but has a nice
stub to match it....so build a 5/8w using that stub to match
it. Problem is the standard way ("L")is just as simple.
Thanks for correcting my sloppy thinking, 73's

I've had a BC100XLT, BC200XLT, and BC205XLT, and know the part
in question. Two screws fasten the spring to the bottom of
the BC100XLT.

The service manual for the BC200XLT doesn't show
a picture of the spring. My best guess is that the spring
corresponds to the following part from the the 200XLT parts list:

Part no. Description

HPSP421080Z Plate; spring C5210R 0.3T NI

To receive 800Mhz, you need to add 2 SMD (part 9110 from Icom)
to the underside of the F2 Board. It involves taking the
unit almost completely apart.

The service manual illustrates how to disassemble the unit.

Regards.

Source record: 191873

In a matched sytstem, the coax length does not matter except for a small amount of loss. I think the confusion comes from the way most of us amateurs measure SWR. We actually measure VSWR, or VOLTAGE Standing Wave Ratio. We could as easily measure Current SWR, but not so easily as our sampled lines and schottky diode peak detectors. If we "tune" and antenna for 1:1 vswr with a given length of coax, and than at some time in the future, add coax, we may find that the VSWR (and Current SWR) have changed. However, if we had "tuned" the system to be 1:1 ALL ALONG the line, no change would be indicated when we at some future time changed the line length. What is going on here is IMPEDANCE TRANSFORMATION. If we measured POWER instead of voltage or current SWR, we would find NO CONFLICT. Indeed, the SWR would remain the same along the line whether we are matched to the system impedance or not. Note that even the popular Bird Watt Meters and their derivatives actually measure PEAK RF VOLTAGE, but are calibrated in power, so you are not getting a correct power measurement in an unmatched system. To get a PROPER measurement of power you must measure BOTH voltage and current at the same place on the line and take the product of the two. If the voltage goes up, the current will drop accordingly. If the voltage decreases, the current will increase accordingly such that the PRODUCT of voltage and current is always the same - the coaxial line can't change the power of a wave in the line or we would have a perpetual motion (RF producing) machine! ! ! ! You better patent it QUICKLY! ! ! !

Something to think about: What does a half-wave length of line do to the reactive part of the impedance? The answer may help understand how a VSWR meter (voltage) can indicate more our than in.
Hint: Can you build a resonate circuit for a VFO with ONLY variable capacitors and half wavelengths of transmission line?

1536. Problem with HTX-212

Newsgroup: rec.radio.amateur.equipment
Date: 1996-10-29 00:00:00 UTC
From: jrdavis@mail.delecoelect.com
Message-ID: <555igs$bjp@kocrsv08.delcoelect.com>
Source record: 191675

I have an HTX-212 out of warranty that continues to blow one of the TX/RX diodes only in HIGH power mode. The schematic is at home so I don't know the reference designator, but it is the diode near the antenna that has a 100 ohm resistor in series to ground. Its purpose is to shunt transmit power away from the receiver circuitry. The first time the diode blew it and the 100 ohm resistor burned a hole in the PCB. I have cleaned the carbon almost completely away as I know it can conduct.

I have used exact replacement parts for the diode, 100 ohm and a sticklead 001 cap. The .001 gets hot and eventually the diode smokes. It takes about 20 seconds for the smoke to start. With a SWR/Power meter I can see that I am transmitting about 50W and SWR is a little high at 1:1.4. At the diode, the DC bias is 7.2v which, according to the schematic and service manual, is correct. I do not have an RF meter but I suspect it is RF power that smokes the diode. (DC bias is the same in low power but no smoke.)

What else should I look at? Could high levels of harmonics off the output transistor cause this problem?

Help is appreciated. Has anyone else experienced this problem?

> KB0YNP

I've been remiss in posting the results when I asked that question; I apologize.

I got many pro-Yaesu responses; I was quite interested to see what everybody thought. In the end, I actually ended up getting neither; I got an ICOM W32A, mostly after handling it and the Yaesu, and finding I could operate the thing more easily (the buttons are spaced a little better for me, that sort of thing...). They had pretty much equivalent features, which eased the process somewhat. That said, I reallly enjoyed what I saw of the Yaesu, and the Kenwood just didn't hold my interest me when I played with it. (On the down side of the Kenwood that was pointed out to me at the store was that although it's backlit, the keys aren't lit!).

I've had my Icom for about a month now and I love it. I'd recommend it to anyone that asked, but without real time with the Yaesu, I don't feel comfortable making claims that it's better or worse. But it fits me well.

Anyways, here's what other folks had to say:

I originally wrote:
>
> I'm preparing for the purchase of a dual-band HT, and I'm interested in
> hearing from folks using either the Yaesu radio, or the Kenwood TH-79A.
> I've read the specs pretty closely, and am interested in first-hand

>
> Thanks in advance!
>
> --
> Ray Rischpater, KF6GPE dove@lothlorien.com
> #include <disclaimer.h>

And the responses I got were:
Ray,

I own the 79A, but would like to have the 51R. Two things are important
to me:

the 51R is can be computer controlled
the 51r has a speaker mike that is backlit and shows frequency

I will say that my 79A's dual volume controls are quite nice to have.

Good luck and 73.

Harold
KE6TVO

I have an FT50, two friends of mine have FT50s as well. I bought the
FT50 first thing after owning and FT40 for awhile.

The FT40 was a great HT, very intermod resistant. The FT50 is still a
good HT, but the squeltch does open in some RF dense environments.

My gripes with the FT50:

Need to get the FTT12 keypad to do PL decode, I really like PL
decode. PL decode is very sensitive, so if you are listening to a
noisy signal which has the wrong PL (and should therefor keep the
radio quiet) the squeltch breaks on occasion when the noise crosses
the PL. Most other HTs I've had have had some debounce for this.

No Mac/Linux programming software available. A general gripe with me
for most ham stuff.

SMA connector, tho I'm pretty used to this, so it's no big deal.

No backlit keypad, but the keypad, as well as the whole radio, is very
rugged.

Goofy speaker-mic plug, can't find connector for it, but Yaesu makes
an adapter.

Otherwise it's a GREAT HT. Great audio, great features, great
accessories (it's derived from a commercial line) such as a drop in
slow charger ($20) which I thought was a good alternitive to the more

expensive fast chargers. The HT is easy to use, built well (Mil spec and all that) and just feels good in my hand, espically with the RH-1 rubber protector. I've never liked Kenwood stuff, just a personal prefrence. The FT50 is as close to commercial gear as you can get in the ham world yet still has some very good features. Plus the FT50 was pretty well priced last I checked.

Feel free to ask any questions!

Steven M. Knapp

Hi Ray,

I would not recommend the TH-79A since the batteries will usually fall out and it has a lot less features..

The FT-50R or FT-51R (Yaesu) have Windows PC programming, DC voltage readout, CTCSS tone search, 4+ power levels and much more features....

Yaesu has much more features..

Good Luck !!! and 73's,

Kevin

PLEASE do not buy Kenwood the following list is radios in a 8 year period that had to be
sent in for service.
TS-850
79A
77A X 2
741A
631
450S
TK330 X 2
AND A CD PLAYER AND CAR STEREO DO NOT MAKE THE MISTAKE KENWOOD SERVICE SUCKS SO BAD THERE
IS NO WORD ON EARTH THAT CAN BE USED.

Buy Icom or Yaesu Standard the product is good and super service!

That's not true at all Lloyd.

Six meter power amplifiers are VERY legal, they just have to meet part 97 or have been grandfathered in on a waver. The basic idea is drive power must be more than 50 watts, and no operation between 25-30 MHz. The INTENT was to stop CB.

Mirage makes a six meter amp that is fully FCC type accepted and legal to sell, and puts out 160 or so watts. It has been grandfathered in at low drive power, even though the new requirement is ten watts.

I'm about to connect a Kantronics KAM+ to my Icom 706. I'm looking for any hints on wiring and operation. I've been using packet on VHF for several years, but this will be my first attempt at HF digital.

One question off the top: Which filter is best for digital. The 706 has a "RTTY" filter for that mode, of course. Is that usable for the other digital modes as well?

Thanks and 73,

Gary KN4AQ

1556. Drake TR7 CW Offset problem

Newsgroup: rec.radio.amateur.equipment
Date: 1996-10-29 00:00:00 UTC
From: mreising@aol.com
Message-ID: <554s35$7jf@newsbf02.news.aol.com>
Source record: 191789

Has anyone had problems with the CW offset on a TR7 being too high (~1000 Hz)? I tried increasing the series capacitance with the crystal and even shorted across the trimmer capacitor to ground, this brought the offset to 1070 Hz. I replaced the crystal and managed to get the offset down to 970 Hz but it will go no lower. It would be nice to have the offset at 800 Hz where it belongs. Any thoughts would be appreciated as would direct reply via e-mail. 73 de Mark, WB9BVV

1557. FAQ: Plectron and Motorola Alert Monitor Receivers

Add a Plectron or Motorola Alert
Crystal Controlled Monitor Receiver
to Your Scanner Collection

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author.]

In the 1960s and 1970s, thousands of firemen and ambulance squad members came to rely on their transistor Plectron and Motorola monitor receivers. They have now been replaced by portable pagers, and are often available at hamfests in the $5 - $25 range. Since many are in rough condition and need repair, a hamfest special is better suited for hobbyists who like to fix their own radios.

Plectron and Motorola crystal controlled receivers are excellent for dedicated monitoring of local frequencies -- a task for which you wouldn't want to tie up your 400 channel programmable scanner. They can be powered from 117VAC or 12VDC with the proper mobile cord. The audio quality of a Plectron P1, Plectron 700 series, and Motorola Alert Monitor is far better than any consumer grade scanner and the sensitivity, image rejection, and intermod immunity is outstanding when aligned properly.

The Plectron and Motorola Alert monitors are single band receivers: VHF-low, VHF-high, or UHF. No single Plectron or Motorola Alert monitor can cover the entire 30-50 MHz band, so there were versions optimized for each portion of the VHF-low band. There were different versions to cover low and high "splits" in the VHF-high band, too. Although UHF versions were made, they are somewhat rare and coverage is limited to 470 MHz and below.

Plectron made several models with dozens of different options. Both the original P1 and later 700 series are suitable for restoration, although I prefer the newer 700 models. The Plectron 500 "economy" series is less desirable.

The P1 series have black cabinets with a blue-green and silver color scheme used on the front panel. They were made in the Chief (tone decoder & carrier squelch), Patrol (carrier squelch only), and Sentry (tone only) models. The Sentry models lack a carrier squelch and therefore are of little use to hobbyists except for scavenging parts. Model number and frequency information appears on a gummed label on the rear panel:

Band (MHz) Chief Patrol Sentry

_____
25-54 R19 R15 R17
148-174 R20 R16 R18
450-470 R23 R21 R22

Table 1. Plectron P1 models

The R700 series have black cabinets with brown front panels and are slightly smaller than the P1 receivers. R700s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

_____
25-54 R719 R715
148-174 R720 R716
450-470 R723 R721

Table 2. Plectron 700 models

The Plectron FM Receiver/Recorder is a collector's item. It is essentially a 700 series Chief receiver with a built in cassette tape recorder. The recorder is carrier activated and can tape transmissions while the receiver is unattended. A connector on the rear panel allows for all kinds of remote control possibilities.

I use two Plectron P1s and four R700s in my living room, seven R700s down the basement, and several Plectrons and Alert Monitors stored in reserve. The basement Plectrons are turned on automatically when someone walks downstairs. Power to them is controlled by a modified Radio Shack Safe House infrared motion detector, originally sold as an intrusion alarm.

When a rescue squad member from Missouri advertised a number of Plectrons on USENET, I bought them -- all 20+ of them. I cleaned, fixed, and restored each one. After recrystalling them on local frequencies, I distributed them to members of my scanner club who were glad to get them.

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies

far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency.

AC power cords for both types of receivers use unique connectors and are scarce. You can buy them new but it's much cheaper to drill a hole on the rear panel and attach a permanent a power cord. Make sure you use a grommet in the hole to prevent the metal chassis from chafing the line cord.

Many Plectrons and Alert Monitors were equipped with an internal NiCd battery pack, intended to power the receiver if the AC power fails. It's unusual to find a used monitor receiver with the NiCd pack still capable of holding a charge. More often, the batteries have died and the series charging resistor has overheated and burned. Be sure to remove the dead batteries as they often leak.

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

I have not used the Plectron tone alerting features so I cannot address that except to say that the special coils and capacitors for the dual tone decoders vary depending on the tone frequencies and are somewhat difficult to obtain. Repair service for the Plectron P1 and R700 models is offered by:

Woodson Electronics
Plectron Place
P.O. Box 960
Imboden, Arkansas 72434

telephone 1-(501)869-7985

Some replacement parts are currently available from Federal Signal in University Park, IL, phone (800)524-3021. You can also get Plectron repairs and parts from:

Northeast Communications
4 Oak Ridge Rd
Newfoundland NJ 07435
201-697-8804

Alert Monitor parts are available from Motorola. Phone (800)972-3226.

I currently have no Plectrons or Motorola Alert Monitors for sale. I'm hoarding them. :-)

The SB620, a similar device, allows you to also inject an oscillator into the cathode of the input tube and thus use that input tube as an additional step of conversion. Presumably one could inject a 70 MHz signal there and view a 73.395 MHz IF. I haven't tried this, but I would bet money it would work. They didn't intend it to be used this way, and don't mention it in the manual. The additional input was intended to use it as some sort of spectrum monitor.

If your HO13 has this same provision, try it out with a signal generator at approx 70 MHz. If not, have a look at the SB620 schematic - you can probably add circuitry to inject the signal if your "front end" is similar.

I would certainly add the TS-870 to your evaluations. IMHO, it has the best receiver of the lot. Personally, I think the FT-1000MP is a little too loaded up with bells and whistles and the TS-870 has it about right in that department.

As always, YMMV.

baxter> N0FPZ

If you were using the FT-50R's factory rubber ducky antenna, I firmly
believe what you wrote -- that rubber ducky antenna is a poor VHF
antenna and a horrible UHF antenna and almost not an antenna at all on
other frequencies. What sort of antenna were you using to listen to
220MHz? Hopefully a wideband Discone adapted to the FT-50R via the
BNC to SMA adapter. If you were using the stock rubber duck, the
radio may work just fine but the antenna would be so bad on that band
you would never be able to accurately judge whether the radio worked
or not.

As an economist, you should know that any comparison of this sort needs
to be done in constant dollars. Go back and see what a Collins S-Line
cost in 1966. Then look up what the cost of a top of the line
transceiver such as the Yaesu FT-1000MP plus accessories costs today. Do
the math and then tell me that prices have skyrocketed.

This comment partly answered a question I have been meaning to ask. Not every
reason to want an out of band radio is a "Lame Excuse". I am a licenced Amature
radio operator N1WGD. I am also a licensed Emergency Medical Technician who
volunteers for two rescue corps each with its own frequency. This often leaves me
with three radios handy. It would be very nice and convienent if I could have one radio
that would transmit and Rx both the 2m ham band and the 155 Mhz Public Safety band as well.

I was going to ask if there was a model/brand of HT that has good performance on the 2m band
but still can be modified to have decent performance out of band as well. I could purchase a
VFO type commercial HT and a separate 2m HT but it would be prohibitively expensive. If I
understand your comment quoted above properly, even if I get an HT that can operate out of
band it would not be legal for technical reasons? Any comments would be helpful.

Message-ID: <5558tt$27l@coranto.ucs.mun.ca>
Source record: 191811

Here is the message I found but can't trace the owner.

```
|
| Attention All BC8500XLT Owners (or future owners)!
|
| Don't count this one out yet!
|
| I have successfully got this thing so it is a coninuous receiver from
25 to
| 1300 MHz. It allows direct keyboard entry of any frequency. If you
are doing
| an AUTO search, the freqs are properly stored in memory locations! (I
get
| excited about this because my first attempt wouldn't allow direct
keyboard
| entry or to save freqs in memories! But never fear, ALL works great
now!!!)
| I have already modified two with no problems at all!
|
| So everyone hang tight, I am trying to get a hold of the scanner guy at
| Popular Commuications (and others) to see if they want to publish.
|
| -Jon
```

```

I called Yaesu and asked if you _could_ put the VX keypad in the TF-50.
They told me that the conectors were in different places; they keypand
would not fit into the 50. But I infered that they were compatable none
the less.

1584. DC Power Plug for Kenwood, Icom and Alinco

Newsgroup: rec.radio.amateur.equipment
Date: 1996-10-29 00:00:00 UTC
From: n2cjj@ibm.net
Message-ID: <555n66$p5g$2@news-s01.ny.us.ibm.net>
Source record: 191817

I have found a source for those DC power cord plugs. The ones I've got have use male plastic with 6 metal female (barbed) inserts.

The plug fits most 12VDC HF radios:
Icom 720, 730, 735, 706..and alike, newer Yaesu and Alinco DX70.
Kenwood-TS120, 130, 140, 430, 440, 450, 850..TS50, 60, 660, 670, 680..and more.

Make your own power cord yourself, YOUR WAY!
Crimp or solder, short or long, heavy gauge wire, purple with pink polka-dots...

Each DC Plug comes complete with 6 crimp/solder inserts
for $4 each, or the deal 3 for $10.

All prices include postage in the US and Canada.

To order, kindly send a check in US funds to:

Robert Langston
286 Hudson Street
Cornwall-on-Hudson, N.Y. 12520

You can also email me for info at: n2cjj@ibm.net

It's a great deal if you use one rig at home, in the car or at work and are stuck re-connecting and dragging the power cord all over....

It sure beats paying $30 for a spare from your dealer.

Chuck,
I suggest you read about some of the problems people are having with extended receive here. For data on how easy it is to get extended transmit go to:

http://members.gnn.com/hca/ft50/index.htm

I did it myself, just remove a solder blob, and hold down a bunch of weird buttons (one of them 'poorly named' is the center button on the side that breaks squelch) when you power the radio back on. It is described in detail in a file at above site. I bought my FT-50 about three weeks ago from HRO, Denver, and they also sold me the ADMS-1 S/W, and my radio is cookin'. I don't know what these other folks problems are unless the ADMS S/W has been updated. Also, it did take a couple of tries before it worked on mine. It's all very easy, in my opinion.

That's correct, you cannot use an amateur radio in Part 90 service.
That's because the FCC requires those radios to be Type Accepted,
but amateur radios are not Type Accepted. Type Acceptance is a set
of requirements the radio must pass to be allowed to be used on
commercial frequencies. A key feature is that the user can't tune
the radio off his licensed channels. Modified amateur HTs, of
course, let you do that, so they cannot be Type Accepted. There
are a number of other criteria as well, but this is the killer
for using amateur HTs outside the amateur bands.

Now you *can* go the other way. If you get a multi-channel Type
Accepted commercial radio, you can have the radio shop program
any extra channels into the amateur band. This isn't as flexible
as an amateur HT since the number of channels in most commercial

radios is sharply limited, but it is a way to get a favorite repeater or two and a simplex channel or two into your commercial radio. Just remember which channel is which. This is legal because you are licensed for all these channels, and you still can't tune the radio to a channel for which you are not licensed, so you haven't voided the radio's Type Acceptance.

If you hunt around, you may find an older Type Accepted radio which *will* let you program your own frequencies. These are no longer acceptable as new, but the old ones are grandfathered in, so you can have the best of both worlds. Be careful, however, not to program in a channel for which you aren't licensed. The reason user programming was outlawed was because users were popping up on channels where they weren't licensed, and that pissed off the people who were licensed for those channels, and they raised hell with the FCC.

>One question off the top: Which filter is best for digital. The 706 has a
>"RTTY" filter for that mode, of course. Is that usable for the other
>digital modes as well?

RTTY uses the standard SSB filter unless you've installed an optional narrow filter. If you have the FL-100 500 Hz CW filter installed, it'll use that when you push NAR. And it repositions it properly too. But note that RTTY mode really is FSK, not AFSK. You have to key it via the RTTY keying line, not by feeding AFSK tones into it. There's a menu option for setting the shift, and whether it is inverting or normal. You have to get this right for RTTY, 170 Hz shift and normal should work. This should also work for AMTOR. For Packet you want to change the shift to 200 Hz, keying polarity doesn't matter for packet.

The optional 250 Hz filter is too narrow for data use, and rings too much for CW (IMHO) so you don't want that one, but the 500 Hz CW filter works fine for RTTY and AMTOR. It's a tad tight for packet, but it'll work there too if it's positioned properly. You might want to tweak IF shift for best response. Note, you can only install *one* optional filter, and this is the one you want.

Note, I don't know whether the KAM supports direct FSK keying or not, but the radio does. In RTTY mode you're directly controlling the DDS, and that's very clean. I suggest you use that rather than running AFSK if the KAM will let you. Use power set to throttle the radio back to about 50 watts unless you intend to make only short transmissions in RTTY (yeah, right, nobody makes short transmissions in RTTY).

If you want to use AFSK, then you have to use LSB mode. NAR in this mode puts in the SSB narrow filter if you have that installed (remember, you can only install *one* optional filter). That won't make much difference for data, however, since it is still much too wide. But there's a trick. If you install the FL-100 500 Hz CW filter, but *tell the radio* by initial set menu item 19 that you've installed the FL-223 narrow SSB filter, it'll let you use the 500 Hz filter for receive on LSB. You can adjust the IF shift to center the signal in the filter. If you want to go back to CW or RTTY mode, you have to go back into the initial set menu and tell the radio it really has the FL-100 in it, or it won't work right in those modes. This is a kludge,

but if AFSK is all you can do, this is a way to get a narrow filter
in LSB mode.

Be sure to turn off the speech compressor, and set microphone gain
for about 50 watts output.

FT-50R??
I know but why do you want to! If you are MARS/CAP then you should have no problems getting it done for you? But you probably wouldn't be here if you were no would you? This makes me wonder what you want the mod for? E-mail me with your reasons and I might mail you the right pages from the service manual.

1599. Question about HP8640B Option 323

Newsgroup: rec.radio.amateur.equipment
Date: 1996-10-30 00:00:00 UTC
From: "Bruce J. Howes KG2IC" <kg2ic@amsat.org>
Message-ID: <3277F17A.1F0B@amsat.org>
Source record: 191632

Hello, and thanks for reading my question. I am looking for a signal generator for amateur radio use. I came
across a former miltary HP8640B with the 323 option. After examing it I noted a few items. First, the last
digit in the frequency display is not stable, jumps around, is this normal, or a symptom of a common problem.
Second, when using the unit in the FM mode I can not see any modulation present on the output waveform using a
Tek TDS410A scope, is FM modulation easily observable on a scope? Third, what is the 323 option? Tucker lists
the 323 option as removing the "phase locking". Any ideas, comments, or suggestions are welcomed and
appreciated!

I haven't tried listening around 100Mhz. Having looked at the circuit diagram, I can't see an easy fix other than mving the Xtal to say a hundred Khz lower. That controller has leads going everywhere. As you say it is under warranty so Yaesu should fix it. It's certainly a nice rig . I really gave it a good play on 15 and 10 during last weekends contest. Much better RX performance than my IC751, especially with the 2khz filters fitted.

Please do not disregard situations where the line can be used for
matching. Take a quad loop, with 100 Ohms input impedance.
A quaterwave of 75 Ohms line, with a few coiled turns for a balun
will save you an antenna tuner. And there a other situations
where matching is simplified (less losses) when using a defined
length of line for tranformation.

Mike:
There was an article in QST (1995 or 1996, probably 1995), for low horizontal loop antennas, design, feeding, and performance. It was under the heading of NVIS (Near Vertical Incidence) propagation, meaning that it was good for local contacts.

From: baack@maine.maine.edu
Message-ID: <5587eq$pqo@sol.caps.maine.edu>
Source record: 191645

Hello All,
I have purchased the 6 meter converter from Ten-Tec that I want to use with the Kenwood tr-9130 rig.
The manual states that I can "change a resistor" so I could drive the converter with a power level up to 10W.
HOWEVER, the TR-9130 wants to put out 10-12 W on ssb (voice peaks) . How can I adjust for the 2W variation? I don't want to overload the converter...

Do I need to build and external attenuator?

What is the easy // rather cost effective solution?

Thanks,
Jason Baack N1RWY

Excellent example here. I fed a triband quad with this method for several years. It was the only way I could get a GEM Quad to play with a single 50 ohm coax to three tuned 75 ohm quarter wave stubs.

Sim-lim tower and Sim-Lim Square. Easy to reach with the underground,

You REALLY will have to search meticulously for HAM gear in all those electronic stores. There are no specific HAm stores, they sell all kinds of stuff mixed; HiFi, world receivers, cameras and ham stuff and so on. (at least when I was there, a year ago)

In any case, these Sim Lim locations are a heaven for the electronics shopper. TONS of little stores and very interesting gadgets.

The best deals on ham stuff you can get is for slightly older models. I had real good deals on some Icom radios.
It is custom to bargain but don't overdo it. The best you can get is 15% off, but settle for 10% if negotiations are tough, it is still a good deal.

Good luck and have fun

Loek

There's an important issue that has not been mentioned.
If your SWR is 1:1, coax length is unimportant.
If it's not, then the impedance looking into the coax is a function
of the length. Draw a (constant SWR) circle on a Smith Chart. As you
change length,

you move around that circle. As long as your transmiter can match any impedance on the circle, you're OK. With a high SWR or with a modern no-tune rig, you might find that the rig behaves significantly differently depending on the coax length. SWR doesn't change, but the matching network required to drive the coax sure does.

Having said that, I suggest you put your effort into making the antenna 1:1 rather than messing with the coax length.

Hi Gary:

I am using that exact configuration. I wired it for FSK and AFSK using
the accessory plug out the back of the 706. FSK <RTTY> is awesome in
that the filtering is the best. The results have been nothing short
of fantastic. Enjoy!

R-390:

Excellent condition save for the usual surplus gear scratches on the grey front panel.

In good alignment; a truly superb receiver. For sensitivity and filtering out of spurs from strong local sources it beats hell out of my Icom R-70.

Offers?

Shipping from New York, BTW.

Icom R-70: 1986 model. Again, EXCELLENT condition. Looks brand new.

Offers?

Shipping also from NY but also could be from England.

Finally some sensible information. Most all of this is in the 450-451 Mhz areas. A few rare one have been caught in the 170Mhz press freq ranges. The only exceptions are those that have moved up to encrypted UHF to prevent unauthorized use of their information.

Here in Maryland 450.4875 and 450.850 Mhz have plenty of activity in the Beltway area, and makes for some good listening too, more fun than some morning zoo stations.

I want to try a horizontal loop for HF...something that I can load into with a tuner on 80-10 meters. I have plenty of area to work with so size of the thing is not a problem. Anyone with advice on the proper design of these? If memory serves me right, they are cut as full wavelength...not sure of the feed though if it is suppossed to be balanced or not. I simply want to try something that will work just a tad better than a G5RV (which I have used in the past). Any thoughts are appreciated!

I wasn't suggesting that the original poster rule *anything* out. I was
suggesting that he consider the 870 along with the Icom and Yaesu. I
think your suggestion to include the JST245 in the mix is a good one,
even though it isn't as well known as the other three.

Want to give a thumbnail review of your experiences with it so far?

1642. EARN $50.000 LEGITIMATELY IN 6 WEEKS

Newsgroup: rec.radio.amateur.equipment
Date: 1996-10-30 00:00:00 UTC
From: gs34754@pinus.cc.etf.hr
Message-ID: <55849q$smd@bagan.srce.hr>
Source record: 191712

Subject: EARN $50.000 LEGITIMATELY IN 6 WEEKS
Newsgroups: alt.answers
Summary:
Keywords:

PRINT THIS OUT AND SAVE THIS POSTING ON YOUR COMPUTER,
READ IT OVER A COUPLE OF TIMES,
INVEST,
AND WATCH THE MAIL BOX FOR THE MONEY!

$5, plus the costs of 5 envelopes, 5 peices of paper, 5 stamps and
a couple of hours on a computer and get $50,000
or more back in about six weeks!!!!!!!

Invest in this TOTALY LEGITIMATE oppurtunity,
Remember that this is legal, so you should report the profit of your
investment on your taxes.

Hello, I saw this news group posting and decided to invest $5 into
it and see what I get in return. Hey, what's $5 ? Keep my address and
keep in touch on the amount of money you get. In the posting I saw the
person had done this before and made $47,326 in six weeks with his $5 and
the cost of the stamps to mail the $5 to the five people on the list.
This was his second round. If you do more than the 200 listings you will
make more money.

In this day what does $5 get you, and with all the people on the
internet you are going to get you $5 back in days.

Make $50,000 with a small amount of effort and a small cost of only
$5 and a few hours of computer work (after you have saved this article on
your computer, you can use it to compose your own article, if you want;
just make the neccesary changes, like changing the names below; it should
save you a couple of hours of computer work).

This is a chance for the average person to get ahead in life so
please send out $5 and put a little effort into your postings, and then
watch the money roll in.

This investment will cost you only $5, five stamps, envelopes, paper
and a little computer work. If YOU and EVERY OTHER INVESTOR is HONEST and
follows through with the plan, you will make $50,000 in about six weeks.
Each investor will also make $50,000 in six weeks.
THIS IS A LEGITIMATE INVESTMENT OPORTUNITY !!!!!!!
When the money comes in, make a list of your investors, and you just
started your own ORDER SERVICE COMPANY (don't worry, you don't have to do
anything special, just read this article to the end, and you will get all

the information you need). Since you are starting a company
that provides a service, you make the money LEGITIMATELY (that's the
whole idea about this company business). The service you provide is the
"list of investors" that you have compiled.

You invest $5, and you receive a return on your investment. So does
the next investor. NOT ILLEGAL, NOT A CHAIN LETTER - PERFECTLY LEGITIMATE.

There are other plans like this out there that ask you to send out
$10 to five pepole, thats a fifty dollar investment and its hard to give $50
out when you are struggeling to pay the bills already. But with this
plan you only invest about $5 and others only invest about $5. Hey what's $5
now-a-days? You could probably find that in the cracks of your couch.

If you are not interested, than don't participate, but please print
this article and pass it on to someone who may be interested, so they can
take advantage.

THIS IS WHAT YOU DO:

The procedure is simple:
1) Write your name and address and an e-mail address, on 5 sheets of
paper. Below that, write the words: "Please add me to your list". Then
fold a $1 in each piece of paper (make sure the money is inside the
paper, so that it can't be easily stolen, send no coins) and send them to
the following five addresses:

1. Allen Malkowitch
23 Baker Street #712
Denver CO 80203
USA

2. Wilma Vogel
Broettenstr. 19/25
9020 Klagenfurt
AUSTRIA

3. Lenny LaForget
364 Delisla
Chicoutimi
G76 3B4
CANADA

4. Goran Stojsic
Ljubljanska Avenija 2
236/B
10000 Zagreb
CROATIA

5. Robert Radovic
Ljubljanska Avenija 2
224A/A
10000 Zagreb

CROATIA

2) Now remove the top name from the list, and move the other four names up. In other words, #5 should become #4, and so on. Put your name as the fifth one on the list. Any simple text editor will do.

3) Post the article to at least 200 newsgroups. There are 17,000 of them these days, so it shouldn't be hard to find many. Spend some time on your investment and post to as many newsgroups as you can, and the bigger the newsgroup is, the more people are to see your message and the more money you make. So post to as many as you can.

You are now in an ORDER SERVICES BUSINESS, and should start seeing returns within a week or two. Of course, the more newsgroups you post to, the greater your return is. If you wish to remain anonymous, you may use a psuedonym, call yourself, "The Manager", of "The Boss", whatever, but make sure your address is correct.

HERE IS HOW THE SYSTEM MAKES MONEY:

-Of every 200 posts I made, I received 5 responses. Yes, only five. You make $5 for every 200 posts with your name at #5.

-Each person who sent you $1 now also makes 200 additional postings with your name at #4. i.e. 1000 postings. On average therefore, 50 people will send you $1 with your name at #4. You make $50.

-Your 50 new agents make 200 postings each with your name at #3 or 10,000 postings. Average return= $500. They make 200 postings each with your name at #2= 100,000 postings= 5,000 returns at $1 each= $5,000.

-Finally, 5,000 people make 200 postings each with your name at #1 and you get a return of $50,000 before your name drops off the list. AND THAT'S IF EVERYONE DOWN THE LINE MAKES "ONLY" 200 POSTINGS!

From time to time, when you see your name no longer on the list, you can take the latest posting that appears in the newsgroups, and send out another $5, and put your name at #5, and start posting again. Remember, 200 postings in only a guideline. The more you post, the greater the return.

Let's review why you should do this. THE ONLY COST IS $5. Anyone can afford $5 for such an effortless investment with such SPECTACULAR RETURNS!

You may ask, "what happens if the scheme is played out and no one sends me money?" Big deal, you lose $5. But what are the chances of that happening? We are talking about the Internet here.

There are millions of Internet users, and thousands more joining everyday! YOU CAN'T LOSE!!! There are too many people out there to not miss this message, and there will be thousands new tomorrow.

Remember, read the instructions CARFULLY, and PLAY FAIRLY. That's the only way this will work. Get a printout so you can refer to this article easily.

REMEMBER-HONESTY IS THE BEST POLICY. YOU DO NOT NEED TO CHEAT THIS IDEA TO MAKE MONEY!! BESIDES, NOT PLAYING THE GAME FAIRLY IS ILLEGAL. SO LET'S BE REASONABLE AND PLAY FAIRLY, SO WE CAN ALL ENJOY THE INTERNET GOLD MINE.

GOOD LUCK!!!! :)

I just bought some VHF High Band GE Mastr II's 100 watt mobile units. We plan on putting on our repeater frequency for a main and backup repeater. Has anyone had any experience with doing this? If so any wiring and other information would be appreciated. Any one have any manuals they could send a copy of or send me the manual and I will copy and send back. Also wanting to modify some of these units for Packet any mods would be appreciated for that also. Has any one had experience putting a synthesizer on one? Would also like to get a test set somewhere for one of these units.

Recently bought some Motorola Micors that are on High Band. Need information to convert them to 2 meters any wiring and other information would be appreciated. Also interested in if any one has had any experience putting a synthesizer on them. Addresses for Synthesizer kits.

Hello! I've got some awesome news that I think you need to take two minutes to read if you have ever thought "How could I make some serious cash in a hurry???" , or been in serious debt, ready to do almost anything to get the money needed to pay off those bill collectors. So grab a snack, a warm cup of coffee, or a glass of your favorite beverage, get comfortable and listen to this interesting, exciting find!

Let me start by saying that I FINALLY FOUND IT! That's right!. I found it! And I HATE GET RICH QUICK SCHEMES!! I hate those schemes like multi-level marketing, mail-order schemes, envelope stuffing scams, 900 number scams... the list goes on forever. I have tried every darn get rich quick scheme out there over the past 12 years. I somehow got on mailing lists for people looking to make money (more like: 'desperate stupid people who will
try anything for money!'). Well, when I was a teenager, these claims to 'get me rich quick' sounded irresistible! I would shell out $14.95 here, $29.95 there, $24.95 here, and another $49.95 there. I had maxed out my new CircuitCity Card AND my Visa...I was desperate for money!! So, I gave them all a chance but failed at every one of them! Maybe they worked for some people, but not for me. Eventually, I just tossed that JUNK MAIL in the trash when I got the mail. I recognized it right
away. I can smell a money scam from a mile away these days...or so i thought. I believed I could sniff out a scam easily. WAS I WRONG!!...I LOVE THE INTERNET!!!

I was scanning thru a NEWSGROUP and saw an article stating: 'GET CASH FAST'!! I thought..."Here on the Internet?? Well, I'll just have to see what schemes could possibly be on the internet." The article described a way to MAIL A ONE DOLLAR BILL TO ONLY FIVE PEOPLE AND MAKE $50,000 IN CASH IN 4 WEEKS! Well, the more I thought about it, the more I became very curious.
Why? Because of the way it worked AND BECAUSE IT WOULD ONLY COST ME FIVE DOLLARS (AND FIVE STAMPS), THAT'S ALL I EVER PAY....EVER!!

Ok, so the $50,000 in cash was maybe a tough amount to reach, but it was possible. I knew that I could at least get a return of $1,000 or so. So I did it!! As per the instructions in the article, I mailed out ('snail mail'for you e-mail fanatics) a single dollar bill to each of the five people on the list that

was contained in the article. I included a small note,
with the dollar, that stated "Please Add Me To Your List."
I then removed the first position name of the five names listed
and moved everyone up one position, and I put my name in position
five of the list. This is how the money starts rolling in!
I then took this revised article now with my name on the list and
REPOSTED IT ON AS MANY NEWSGROUPS AND LOCAL BULLETIN
BOARDMESSAGE AREAS THAT I KNEW. I then waited to watch the
money come in...prepared to maybe receive about $1000 to $1500
in cash or so....But what a welcome surprise when those envelopes
kept coming in!!! I knew what they were as soon as I saw the
return addresses from people all over the world--most from the
U.S., but some from Canada, even some from Australia! I tell
you, THAT WAS EXCITING!! So how much did I get in total return?
$1000? $5000? Not even!!! I received a total of $23,343!!!
I couldn't believe it!!

I now have a brand new black Acura Integra to speak for, due to
this!! Now after almost 8 months, I am ready to do it again!!!
Somaybe it was possible to get $50,000 in cash, I don't know,
but IT COMPLETELY DEPENDS ON YOU, THE INDIVIDUAL! You must
follow through and repost this article everywhere you can think
of!
The more postings you achieve will determine how much cash will
arrive in you rvery own mailbox!! It's just too easy to pass
up!!!

Let's review the reasons why you should do this: The only cost
factors are for the five stamps, 5 envelopes, and the 5 one
dollar
bills that you send out to the listed names by snail mail
(US Postal Service Mail). Then just simply repost the article
(WITH YOUR NAME ADDED) to all the newsgroups and local BBS's you
can.
Then sit back, and enjoy walking (you can run if you like! :o)
down your driveway to your mailbox and scoop up your rewards!!
We all have five dollars to put into such an easy effortless
investment with SPECTACULAR REALISTIC RETURNS OF $15,000 to
$25,000
in about 3-5weeks! So HOLD OFF ON THOSE LOTTERY NUMBERS FOR
TODAY,
EAT AT HOME TONIGHT INSTEAD OF TAKEOUT FROM McDONALDS AND INVEST
FIVE
DOLLARS IN THIS AMAZING MONEY MAKING SYSTEM NOW!!! YOU CAN'T
LOSE!!

So how do you do it exactly, you ask? I have carefully provided
the most detailed, yet straightforward instructions on how to
easily
get this underway and get your cash on its way. SO, ARE YOU READY
TO

MAKE SOME CASH!!!?? HERE WE GO!!!*** THE LIST OF NAMES IS AT THE
END
OF THIS ARTICLE. ***OK, Read this carefully. Get a printout of
this
information, if you like, so you can easily refer to it as often
as
needed.

INSTRUCTIONS:

1. Take a sheet of paper and write on it the following: "Please add my
name
to your list". This creates a service out of this money making system
and
thus making it completely legal. You are not just randomly sending a
dollar
to someone, you are paying one dollar for a legitimate service. Make
sure
you include your name and address. I assure you that, again, this is
completely legal! For a neat little twist, also write what slot their
name was in: "You werein slot 3", Just to add a little fun! This is all
about having fun and making money at the same time!

2. Now fold this sheet of paper around a dollar bill ,(no checks or
money
orders), and put them into an envelope and send it on its way to the five
people listed. The folding of the paper around the bill will insure its
arrival to its recipient. THIS STEP IS IMPORTANT!!

3. Now listen carefully, here's where you get YOUR MONEY COMING TO YOUR
MAILBOX. Look at the list of five people; remove the firs tname from
position one and move everyone on the list up slot one on the list.
Position 2 name will now move to the position 1 slot, position 3 will now
become position 2, 4 will be be 3, 5 wil be 4. Now put your name,
address,
zipcode AND COUNTRY in position 5, the bottom position on the list.

4. Now upload this updated file to as many newsgroups and local bulletin
boards' message areas & file section as possible. Give a catchy
description
of the file so it gets noticed!! Such as: "NEED FAST CASH?, HERE IT
IS!,"
or "NEED CASH TO PAY OFF YOUR DEBTS??," etc. And the more uploads, the
more money you will make, and of course, the more money the others on the
list will make too. LET'S ALL TAKE CARE OF EACH OTHER BY BEING HONEST
AND
BY PUTTING FORTH 120 PERCENT INTO THIS PROFITABLE & AMAZING SYSTEM!!!
You'll reap the benefits, believe me!!! Set a goal for the number of
total
uploads you'll post, such as 15-20 postings or more! Always have a goal
in mind!!! If you can UUE encode the file when uploading, that will make
it easier for the people to receive it and have it downloaded to their

hard
drive. That way they get a copy of the article right on their computer
without hassles of viewing and then saving the article from the File
menu.
Don't alter the file type, leave it as an MS-DOS Text (***.txt) file.
The best test is to be able to view this file using Microsoft's Notepad
for
Windows 3.x or WordPad for Windows '95. If the margins look right without
making the screen slide left or right when at the ends of the sentences,
you're in business!

5. If you need help uploading, simply ask the sysop of the BBS, or"POST"
a message on a newsgroup asking how to post a file, tell them who your
Internet provider is and PEOPLE WILL ALWAYS BE GLAD TO HELP. I would try
to describe how to do it but there are simply too many internet software
packages with slightly different yet relatively simple ways to post or
upload a file. Just ask for help or look in the help section for
'posting'.
I do know that for GNN, you simply select 'POST' then enter a catchy
description under the subject box, choose 'ATTACH', selecting 'UUE' and
NOT 'TXT', then choose 'Browse' to go look for the file. Find your text
file CASH.TXT and click on it and choose 'OK'. Place a one line
statement
in the main body section of the message post screen. Something like
"Download this to read how to get cash arriving in your mailbox with no
paybacks!," or whatever. Just make sure it represents its true
feasibility,
NOT something like:" Get one million dollars flooding in your mailbox in
two days!" You'll never get ANY responses!

6. And this is the step I like. JUST SIT BACK AND ENJOY LIFE BECAUSE
CASH
IS ON THE WAY!! Expect to see a little money start to trickle in around 2
weeks, but AT ABOUT WEEKS 3 & 4, THE MONEY STORM WILL HIT YOUR MAILBOX!!
All you have to do is take it out of the mailbox and try not to scream
too
loud (outside anyway) when you realize YOU HIT THE BIG TIME AT LAST!!

7. So go PAY OFF YOUR BILLS AND DEBTS and then get that something
special
you always wanted or buy that special person in your life (or the one you
want in your life :)) a gift they'll never forget. ENJOY LIFE!

8. Now when you get low on this money supply, simply re-activate this
file again; Reposting it in the old places where you originally posted
and
possibly some new places you now know of. Don't ever lose this file,
always
keep a copy at your reach for when you ever need cash. THIS IS AN
INCREDIBLE TOOL THAT YOU CAN ALWAYS RE-USE TIME AND TIME AGAIN WHEN
CASH IS NEEDED!

9. (This comment added by Ron Markarian) Hell dude, this is great,
just send the money and wait like 1 week, then all of a sudden, BOOOOOOM!
Mail flood FULL of dollar bills. Hahahaha...its great

>sales of add-on power amp) " . Since when was five watts the leagle
>limit on 6M? Anyone know whast up with that?

FCC rules forbid the sale of *non-Type Accepted* power amps in that frequency range. Of course if Ten-Tec wanted to go to the trouble to get an external amp Type Accepted (as Mirage has done), then there's no problem. The reason for the Type Acceptance requirement is that the FCC doesn't want CBers to get hold of amps that are thinly disguised as amateur amps. To get Type Acceptance, the amp has to meet several criteria which make it unsuitable for use by CBers. Since most solid state amplifiers are inherently rather broadband, it takes some clever design to make them unsuitable for CB use.

Hello,

Has anyone had a chance to try out the new MFJ - 9406x 6m SSB/CW radio? I read the article from last month's QST about it and just put my order in two days ago. I'm just looking to get a start in 6 meters, so I thought this would be the perfect radio. I also ordered the CW board for it, the MFJ - 906 6m antenna tuner, and a CushCraft 6m beam. I do have one question though, for 6m SSB/CW work, should the beam be mounted with the elements in a horizontal or vertical position? Also, is it better to angle the beam upwards or leave it flat (my QTH has hills around it that may interfere with the signal). Thanks

Gary C. Wysocki

So far as I can find out, this may not be possible- but it was one of
the changes that RS did when they brought out the HTX-242!!! Maybe one
of the brainiacs out there can compare traces and programming to
figure out a way.

I have a IC-735 and the noise blanker in this bloody thing stinks. Are there any mods that anyone knows of that will improve it? I get banged on base or mobile, but I can put a 10 meter either online at home or mobile and its quite. I adjusted the NB inside the radio and all it did was to distort the incoming signal at around 10 over 9db. I called ICOM and I was on hold so long I give up. It will cost me about 10 dollars and still got noise, what a deal huh....
Thank you in advance
Dave

1657. Public Service Top 10 List

Newsgroup: rec.radio.amateur.equipment
Date: 1996-10-31 00:00:00 UTC
From: "Stephan M. Anderman" <sanderman@delphi.com>
Message-ID: <JBKx-3I.sanderman@delphi.com>
Source record: 191649

10 Ways to Optimize Your Effectiveness in Public Service Events
by Willam L. Continelli, AB2CA

1) Make sure your radio is in top operating condition. Small problems (such as loose antenna connections, bad microphones, intermittent operation, etc.) may be just annoying during casual operation, but WILL cause major grief under the continuous/severe service of net/emergency operation. If your radio's not in 100% top shape, buy, beg, or borrow one.

2) Don't operate your handheld with it hanging on your belt. Using the radio while it's strapped to your waist reduces your effective radiated power by more than 10 dB. That's a 90% reduction in power! Hold the radio in your hand, with the antenna in the clear.

3) Regarding antennas, those 3" rubber dummy loads may be cute, but you're throwing away 3-6 dB of power when using one. (If you're REALLY into math, compute the loss of a 3" rubber dummy load used on a beltclip). A telescoping half-wave has a gain of as much as 10 dB over a 3" rubber duck and a quarter-wave provides a 4-6 dB improvement. Even a 12-15" rubber duck will boost your signal by 3-6 dB over the 3" ones. Remember that one dB can mean the difference in whether or not a critical message gets through.

4) Have charged batteries and spare battery packs! If you also have a dry cell battery case, fill it with alkaline batteries. Make sure you have enough batteries with you to carry you through, even on high power.

5) Use headphones or an earphone rather than a speaker/mike. Most earphones will plug directly into your HT. Low cost stereo headphones are widely available and will work perfectly with your HT using a mono to stereo adapter. The headphones also have the advantage of concentrating the communications in your ears, while partially shutting out the outside noise. Headphones will also prolong battery life by allowing the radio to operate at lower audio output. A speaker/mike is the worst thing you can use--it doesn't cut the outside noise, it doesn't save batteries, and where is that HT while you're using the speaker/mike?? (Hint--see #2!)

6) Speak slowly and clearly when transmitting! You may take pride in your ability to run your words together and mumble, but the station on the other end may be in a noisy environment and may not receive your message.

7) Check out your ability to use simplex. Even if the operation is being conducted on a repeater, there may be "dead spots", the repeater may go down, or, sad to say, there may be jamming. Even if you can only work the 2 or 3 stations closest to you, a message can still be relayed. To maximize your simplex range, please reread #2 and #3.

8) Listen to net control and direct all communication through him/her. Identify your station when calling net control and keep all communications direct and to the point.

9) If you must leave the radio or the area to which you have been assigned, first seek permission and acknowledgement from the net control station, make your "time off" as short as possible, and check back in with NCS immediately upon your return.

10) Project a good image to the non-hams around you that are part of the event/emergency. This means acting professionally, using basic hygiene skills, etc.

(Please feel free to reprint this in club newsletters, etc., providing credit to the author and "RF Musings", newsletter of the Schenectady Museum Amateur Radio Association - Schenectady, NY. The author can be contacted on the internet at 103407.3364@compuserve.com or at his FCC database address.)

It would be rather glib to just say "Neither", but there is a case for not splashing out the big bucks just yet. You cannot get performance yet from a DSP based radio that approaches that of the best of the old analogue generation. The excellent phase response of DSP filtering and the linearity of DSP detection produce beautiful-sounding audio, BUT analogue to digital concerters are not yet commercially available that can pass the SIMULTANEOUS dynamic range that can be reached by tho old analogue brigade's best examples. The result is a new generation of seductive-sounding radios that can do wonders to clean up signals in moderate to bad conditions, but which degrade very badly thereafter as stages before the DSP selectivity get overloaded. The review of the TS870 in RADCOM about a year ago documents this problem fairly well.

The IC775 has the facility to have a lot of analogue filters fitted, like its predecessor the 765, so it can avoid the problem and work close to the skirts of very big signals, but the use of the narrow analogue filters turn it into a 765 to all intents and purposes, and the DSP clarity is lost.

If I considered a 765 alongside a 775 both with all filters fitted, I'd expect that if one could hear and work something, the other could. Under less than the most demanding conditions, the 775 could switch to a wider analogue filter and use its DSP selectivity to give a noticably clearer audio output. On transmit, the dynamic range required is far less and the DSP radios give noticably cleaner SSB audio.

Synopsis:

Wait a few years for equal or better dynamic range DSP ?

Pick up a 765 cheaply now the trendies are unloading them for the new generation radios, and get the same contest scores ?

Try an Omni ?

Does this help?

Cheers
David GM4ZNX

According to the 1995 ARRL Handbook, it's possible to feed a full wave
loop with coax, no balun, and probably no tuner. I haven't tired it, but
I'm thinking about a full wave loop for 160. It's interesting that a
half wave dipole (about 250 feet long) won't fit in by yard, but a full
wave loop might (each leg of a full wave loop would be about 120 feet
long if in a square). Interesting.

Look in the ARRL Handbook under "Loop Skywire" for a very basic article on these antennas. The article includes a formula for calculating total length.

This article says you don't need a balun. A recent article in 73 (February 96?) suggested feeding with coax and looping 8 turns, 6" in diameter at the feed point to act as a choke.

Until a week ago my only HF antenna was a horizontal loop cut for 40 meters. In the span of two years I worked all 50 states and around 70 countries with this antenna and 100 watts, mostly CW. Last weekend I took it down and put up a loop cut for 80 meters. My only tuner is the one built into my KNWD 450 and it seems to tune the antenna just fine.

Look for me on Sweepstakes this weekend.

I've certainly heard nothing of the sort. It drives my Ten-Tec Titan
just fine.
It's hard to imagine what they could mean by "problems driving certain
amps." The radio has plenty of output and all the keying and switching
options that any of the modern radios have.

1672. KENWOOD TH-79AD(H) MODIFICATION SUCCESSFUL

Newsgroup: rec.radio.amateur.equipment
Date: 1996-10-31 00:00:00 UTC
From: laast21+@pitt.edu
Message-ID: <55ag9d$a2f@usenet.srv.cis.pitt.edu>
Source record: 191664
Cross-posted to: rec.radio.amateur.equipment,rec.radio.scanner,rec.radio.amateur.misc

I've seen questions regarding this in all three forums, so I've crossposted.

Very recently picked up a Kenwood TH-79AD(High-Power) handheld. After searching the net for a day, and finding out not much of anything, I decided to experiment. I'm sure all of you have been looking.

The serial number (date code) on the radio is 7040-something. Brand new unit.

Despite what the original author believes(talked with him yesterday), the published mod for the 79a *DOES* work. I have a couple suggestions to add though.

First, the original mod suggests that you remove the ribbon cable. From the people who have tried this method, it seems as though they have problems with their keyboards. Chances are, the ribbon cable (which incidentally is *really* thin) is probably not being put back correctly. Suggestion #1 - LEAVE THE RIBBON CABLE ALONE.

Next, There is the MARS/CAP modification that tells you to CUT the green wire. From what I've seen and heard, you can only do the MARS/CAP modification or the wideband modification. In my opinion, unless you need specific access to 420-438mhz, I'd leave it alone. I simply did the wideband modification. I'm not going to repeat(or look up for that matter) what freq's it opens up, but I'm summarize the results. EXTENDED RECEIVE AND EXTENDED TRANSMIT.

I talked with an electrical engineer who did surface mount tech work for Panasonic. If you don't know what surface mount tech involves, THINK small. Not just small, tiny tiny tiny. He used magnifying glasses, special lights, and even microscopes to work on some units. It requires special tools.

The people I've talked with have had problems trying to desolder this diodes. THEY ARE WAY TOO SMALL AND TOO CLOSE TOGETHER.

Now listen, I'm just a regular kid off the street. I've assembled heathkit projects, and built little tone generators and the like. I don't have any surface mount experience at all. I certainly don't have the tools or the skill. After talking with this tech, he suggested that I cut the diodes off the board with an exacto knife. Didn't have one of those either. So I used one of those tiny flat head screwdrivers you buy at Radio Shack.

VERY CAREFULLY, I took the screwdriver and pressed down firmly on the legs of the diodes. This literally cut the diode from the leg soldered on the board This would normally sound hard to do, but remember these legs are a FRACTION of a millimeter. After that, I used tweezers to pull the diode off the board. BTW, the diode is glued to the board, but a firm pull removes it. I did this to the two diodes. I removed both diodes cleanly. No damage at all to the

PC BOARD.

Put back the four screws, turned on the unit and blam-o. One modified unit.

Think this is a fluke ? Think I got lucky ? Nope. A friend brought his 79AD(H) over, and he performed the mod exactly the way I had mine. BOOM, clean removal, no problems. No keyboard problems, no iradic operation. Just a clean uncensored radio.

This is not meant to be a standalone mod. Use this message as an addendum to the original modification document. Its like rel 1.5. The filename everywhere is '79a.txt' in the Kenwood directory under mods. The file structure is basically setup the same everywhere, whether it be FTP, HTTP, or gopher. mods/kenwood/79a.txt. Searching a web engine like http://www.altavista.com or http://www.lycos.com or http://www.yahoo.com will definitely yield results.

Hope this answers any questions. Thanks to Renegade.

Hi,

I wonder if anyone has (or knows where i can get hold of)
technical information for a Motorola MT700 FM handi.

I've got one of these units at present, it cost me a couple
of pounds at a local car boot sale, it seems to be working fine.
TX is 461.625 / RX is 456.125 with a 110.9Hz tone squelch unit.

I'm interested in converting it down onto my local 70cms repeater
freq. (433.325) and would be grateful if anyone can give me
some info.

Cheers,
Richard

Hi Dave,
A well-known, well-worthwhile mod is to replace the diodes in
the NB (D31,32 I think) with (preferably matched) hot-carrier diodes. I
used a pair of MRF701, simply because I had them around.

Great little radio.

Cheers, 73 Steve NM2Y / G3YDV

: Hello, and thanks for reading my question. I am looking for a signal generator for amateur radio use. I came
: across a former miltary HP8640B with the 323 option. After examing it I noted a few items. First, the last
: digit in the frequency display is not stable, jumps around, is this normal, or a symptom of a common problem.
: Second, when using the unit in the FM mode I can not see any modulation present on the output waveform using a
: Tek TDS410A scope, is FM modulation easily observable on a scope? Third, what is the 323 option? Tucker lists
: the 323 option as removing the "phase locking". Any ideas, comments, or suggestions are welcomed and
: appreciated!
: --

My manual doesn't show and option 323, so I can't help you there.
It's normal for the *last* digit (if you mean the least significant digit)
of ANY digital device (counters, etc) to "jump around". And that's what
the display in the 8640B is: a frequency counter.
Not sure what FM looks like on a scope-I always use a spectrum analyzer
or modulation monitor.

The 8640B is not a pretty good generator for older technology. Hope
the option 323 doesn't remove the lock mode. That the 'B' models main
advantage over the 8640A.

good luck,
Mike Stansberry

Hello,

Does somebody has some software specialy for the Icom 706. I'm looking
for it and tried several places but couldn't find something.
Would be nice to help me out.

1689. F/S Plectron tone switches

Newsgroup: rec.radio.amateur.equipment
Date: 1996-10-31 00:00:00 UTC
From: Thomas Crist <tcrist@suffolk.lib.ny.us>
Message-ID: <3279233E.F11@suffolk.lib.ny.us>
Source record: 191731

Plectron Multiple Control Solid State Tone Decoder:

For all those interested, I have 6 tone decoder units (model H9 ?) manufactured by Plectron Corp. that were used to remotely activate fire sirens. They consist of a 46.46 MHz FM reciever that recieves an audible tone and causes a timer to trip a switch. They are set up to discriminate three pairs of tones (must have the right combination of two tones to function). The tones and timers are adjustible. The timers trip a relay and will activate whatever. They were all working when taken down but there are no guarantees. They run off 117 vac which is stepped down to 12 vdc @ 1.5w via a built in power supply. Five of these units are mounted in nice boxes 13" wide X 21" high X 7" deep, the other has no box. Each complete unit weighs 32 pounds and comes with installation instructions. I imagine that you could strip out the reciever and use it as a low band monitor (add audio amp). I'll leave it up to your imagination as to what you could do with the complete unit. I also have 2 encoder units which generate the tones for the decoders. One will produce 4 pairs of tones, the other produces about 20. They would have to be used with your own transmitter. Any reasonable offer considered & shipping can be arranged. First come, first served. Any questions e-mail tcrist@suffolk.lib.ny.us.

Thanks!

>Joe

That is correct. According to Part 97.113(a)(4) of the FCC Amateur
Service Regulations, Communications must be in plain language or use
accepted standard formats (like DTMF, Packet, RTTY, etc.).

You cannot hide the meaning of communications by using codes and
ciphers. Having secret access codes for repeater control, for
example, doesn't fall into this category. Neither does using accepted
abbreviations and Q-codes, because they use accepted standard formats.
Using voice scramblers or encryptors is prohibited on Amateur
frequencies.

1691. Re: Removing an Antenna

Newsgroup: rec.radio.amateur.equipment
Date: 1996-10-31 00:00:00 UTC
From: Advanced Education & Labour <kmcdon@gov.nb.ca>
Message-ID: <01bbc768$eb8356c0$6cb48b8e@km38076.AELHO>
Source record: 191733

You should be able to remove the antenna with a putty knife by sliding the putty knife in between the mount and window lifting gently away from the window without twisting the knife. A second option is to use a knife made for removing stickers etc from glass (uses a razor blade to lift the sticker). Sorry I can't be more specific but I have not removed a glass mount antenna for several years. Hopefully this helps.

1694. Zetron DID Converters (Model 50) For Sale

Newsgroup: rec.radio.amateur.equipment
Date: 1996-10-31 00:00:00 UTC
From: kgold@telerama.lm.com
Message-ID: <kgold-3110962027590001@kgold.slip.lm.com>
Source record: 191736
Cross-posted to: alt.forsale,sci.electronics.components,misc.industry.electronics.marketplace,,rec.radio.amateur.equipment,sci.electronics.repair,sci.electronics.equipment,us.forsale.misc

I have TWO Zetron Model 50 DID Telephone Trunk Converters for sale.

These both are in BRAND NEW CONDITION. They were in use for less than a year.

A DID (direct inward dial) line allows each mobile radio or pager to be reached at a unique, seven-digit telephone number, just as in cellular service. A caller doesn't have to overdial extra codes in order to reach a radio or pager.

They were designed to be used with a Zetron Model 45B (Z-Patch), 46 (Trunked Interconnect) or Model 48B (Repeater Manager) but will work with ANY DID installation.

Rack-mount (about 2" high). All manuals included.

This allows each subscriber to have his own unique telephone number!

Original price was $1,000 each. Willing to sell for $1200 for both or $700 each.

email: kgold@telerama.lm.com

Which doesn't make much different in the lower rounds, since every team
has already passed on the prospect at least once. Here's the players
Bobby Cox was able to get because of his high draft position:

1986: Kent Mercker (picking 6th)
1987: Derek Lilliquist (picking 6th)
1988: Steve Avery (picking 3rd)
1989: Tyler Houston (picking 2nd)
1990: Chipper Jones (picking 1st)

Schuerholz had good position in 1991,

1991: Mike Kelly (picking 2nd?)

All in all, it wasn't just early picks that gave Bobby Cox his players.
Everyone else could have been drafted by anyone else.

10/31 Update
What's here: TSR: D&D (1974), Boot Hill, Dawn Patrol, & Top Secret

The following RPG sets are for auction:

1) TSR Original D&D (1974)

Book 1 Men & Magic, Book 2 Monsters & Treasure, Book 3 Underworld & Wilderness Adventures, Sppl 1 Greyhawk, Sppl 2 Blackmoor, Sppl 3 Eldritch Wizardry, Misc Swords & Spells (for miniatures)

Books show signs of wear & tear. Fading covers, scuffs, scratches, small stains, rusted staples (can
you spell de-humidifier ??), writing in most, covers detached on some.

top 3 Bids
sundance@ultranet.com $ 45.00 (10/31)
Daunting@aol.com $ 41.00
russells@crosslink.net $ 35.00

2) TSR Boot Hill

RPG of the wild west, counters punched, good condition overall; box scuffed and dented. Includes Mad Mesa module.

Bids
SCRAWLSFTS@aol.com $ 10.00 (10/30) GOING x2
kpl@dimensional.com $ 9.00

3) TSR Dawn Patrol

RPG of World War I air to air combar, counters 50% punched, very good condition.

Min bid $ 8.00

4) TSR Top Secret

RPG of international espionage, book and charts only; good condition.

Min bid $ 5.00

Notes:

1) Bids in US currency, dollar increments.
2) Buyer pays postage ($3 - $5, I assume)
3) Goingx1, goingx2, sold with 3 days of [high bid] inactivity leading to the next level. Date of high bid is indicated. Order of receipt of equal bids determines high bidder.
4) Cashiers checks, money orders, personal checks (allow for clearance) -- please no cash!

5) Bid updates posted daily.
6) Email bids to pjasek@eclipse.net

Any questions, don't hesitate to email me,
Paul Jasek

Computer animators create a "reel" of their work, which is a video tape. The equipment needed is expensive, but I'm sure there are companies out there who will do it for you. If you go this route, let me know, I'll try to locate one of these companies.

Good luck,

Tom

Bob, as I am sure others will tell you get the right camera for the job.
That said there are some little baby views out there, but the trade off
is wide angle lenses. The 47mm becomes the widest available. MF
cameras, for the most part, tend to be large box cameras. There are some
exceptions. I am not famillure with the Pentax 67 or the Fuji modle BUT I
am famillure with the Hasselblad that has just been released that is
really a mini view. IMHO, too much $$ for too little movements (unless
you specalize in macro).

Get a reflex housing for that view and throw away the darkcloth...

1704. The New Icom IC-756: Have info, want more.....

Newsgroup: rec.radio.amateur.equipment
Date: 1996-10-31 00:00:00 UTC
From: arden@teleport.com
Message-ID: <55ac2r$8q@nadine.teleport.com>
Source record: 191746

The new Icom IC-756 looks like it has a lot of potential. The ads claim that it is a reasonably priced version of the IC-781 behemoth and it certainly *appears* to be such. It has a similar large computer display with spectrum scope but adds IF DSP and 6 meter access. On the other hand, it has far fewer knobs and buttons with many of the features being run from what appear to be nested menus on the LCD display.

I was thinking of buying a TS-870 or even an 850 but I'm tempted to hold off. Does anyone out there have any more info than what appears above? I'm specifically interested in pricing information. The ad on the back of the new HRO catalogue implies that it will be in the same range as the IC-736. Frankly, I can hardly believe this but one never knows. Computer technology and flat backlit LCD displays have come down in price dramatically since the IC-781 was introduced. I guess anything is possible.

1705. Zetron DID Converters (Model 50) For Sale

Newsgroup: rec.radio.amateur.equipment
Date: 1996-10-31 00:00:00 UTC
From: kgold@telerama.lm.com
Message-ID: <kgold-3110962026430001@kgold.slip.lm.com>
Source record: 191747
Cross-posted to: alt.forsale,sci.electronics.components,misc.industry.electronics.marketplace,,rec.radio.amateur.equipment,sci.electronics.repair,sci.electronics.equipment,us.forsale.misc

I have TWO Zetron Model 50 DID Telephone Trunk Converters for sale.

These both are in BRAND NEW CONDITION. They were in use for less than a year.

A DID (direct inward dial) line allows each mobile radio or pager to be reached at a unique, seven-digit telephone number, just as in cellular service. A caller doesn't have to overdial extra codes in order to reach a radio or pager.

They were designed to be used with a Zetron Model 45B (Z-Patch), 46 (Trunked Interconnect) or Model 48B (Repeater Manager) but will work with ANY DID installation.

Rack-mount (about 2" high). All manuals included.

This allows each subscriber to have his own unique telephone number!

Original price was $1,000 each. Willing to sell for $1200 for both or $700 each.

email: kgold@telerama.lm.com

I Have one Zetron Model 810 Digital Hybrid for sale. This is a 2-Wire to 4-wire converter with digital signal processing. It typically is used to connect a standard telephone line to a mobile radio system. It will enhance the audio (especially full-duplex) in trunking, conventional and cellular radio systems.

This unit is in excellent condition. It was in-service for less than a year.

Rack-mount (about 2" high). With Instructions.

Originally purchased for $900. Will sell for $600 or best offer.

From: Gregory Boren <symntlab@netxpress.com>
Message-ID: <3278B08F.7C91@netxpress.com>
Source record: 191751

The HP 8640 opt 323 was a lower option HP8640 used by the military. It's freq counter did not have as many digits, no phase lock, no external input and came in a heavy yellow metal case, which by the way often caused these units to over heat. Also the face plate was different and did not provide as many knobs and switch options. The last digit does typically jump around and you won't see FM changing on the scope, remember your basic electronincs, constant amplitude on FM, changing freq swing. All and all it is not a bad sig gen for amateur use up to 512 MHZ. Good luck.

>something that I could build. An ideas?

>TED - KC8ENM

Since PL is mostly used by the users to enable access to the repeater,
AND many repeaters have PL filters so you cannot hear the PL tone at
the output, there wouldn't be much, if any, PL tone to find on many
repeater's output signals.

Perhaps something constructed with a powerful DSP for adaptive
filtering could zero in, but that isn't an easy chore for the standard
hardware hacker.

Using an external PL generator with a rotary switch, you could
key-down and rotate through the tones unitl the repeater's output
became active. However, this can be crude and illegal unless done
properly and you properly identify yourself.

Just a random collection of thoughts...

My Sony ICF-SW 7600 radio (Italian version) covers the following frequency range 150-285 KHz step 3 KHz, 531-1602 KHz step 9-10 KHz selectable, 3850-26100 KHz step 5 KHz, 88-108 MHz FM step 50 KHz.

The American version of the same radio covers the LF,MF and HF frequencies with the range 150-29995 KHz. I would liKE to obtain the same HF frequency range as that available on the American version but the frequencies 1602 - 3850 KHz and 26100 - 29995 KHz are not receivable on the Italian version!

The radio is controlled by CPU, it has a PLL utility, is equipped with a keyboard and can store 10 items in memory. The receiever is 48055 and 455 KHz double version and demodulates AM and SSB.

At power on the CPU checks the jumper configuration (LW, step 9-10 KHz in MW, SW, FM). Setting the LW jumper to OFF extends the frequency range from 285 to 531 KHz, while setting the FM jumper to OFF extends the FM range from 76 to 88 MHz step 100 KHz. Setting the SW jumper to ON or OFF has no effect, the frequency range remains 3850-26100 KHz in both cases.

* Does anybody have the ICF-SW 7600 schematics?

* Does anybody know how to extend the frequency range from 1602 to 3850 KHz and 26100 to 29995 KHz?

Please send your reply to my e-mail address, as detailed below.

Thanks.

1713. ts-570d impressions

Newsgroup: rec.radio.amateur.equipment
Date: 1996-11-01 00:00:00 UTC
From: hopewell@ctg.net
Message-ID: <846868118.8401@dejanews.com>
Source record: 191575

I played with Kenwood's new TS-570D for a couple of hours last weekend at HRO in Woodbridge, Va. I'm in the market for a mid-priced HF rig and was sold on the Yaesu FT-900AT. But after hearing the difference DSP makes in reception of signals that are weak and/or accompanied by QRM, I think I'm sold on the TS-570D -- even though it's a few hundred dollars more expensive.

Anyone out there a new TS-570D owner? I'd like to hear your impression of it. Tell me why I should (or should not) buy this radio instead of the FT-900. I'm also interested in the performance of its antenna tuner.

Thanks and 73,

Meade Daffron KA4RQB

: In article <32797367.399D@mail.sisna.com>, hagstrom@mail.sisna.com says...

[does the DTMF decode really work?]

Tim Huster (timh@xetron.com) wrote:
: Yup. The DTMF decoder on the FT-50 works fine and dandy.
: Make sure the radio is in DTMF mode. The phone icon has to be lit up.
: DTMF memory #9 is the decode memory. You can monitor a frequency and
: while the tones are received, the digits are displayed in DTMF memory 9.

I have also had problems getting this feature to work, and I was
wondering if one must hit F(W) *again*, so that the cursor is flashing,
before it will decode. I've got it all set, with the phone symbol
showing, waiting on memory #9, but nothing is decoded. I haven't yet
had a chance to try activating the memory input (holding F(W) for 1/2
second *after* 'c9-1' is displayed), but it was something that had
occurred to me.
Is this the missing element? Is it possible that the tones I'm trying
to decode are coming too fast? Thanks in advance for any further
help...

Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc,rec.radio.amateur.space

```
If you are not a registered RF user or are not interested in
radio or micorwave circuit design then hit delete now.

This news item announces that a new version of RF (1.1) is available.

The upgrade is available either via ftp:

ftp.onthenet.com.au /pub/academic/

or via WWW ftp:
ftp://ftp.onthenet.com.au/pub/academic

or simply via the WWW
http://www.onthenet.com.au/~academic

The update is free to all existing RF users although you will
have to contact Academic for a new serial number. The encrypt
key to decode the ftp'able zip file pdisk1.zip is the same as
for V1.0.

Also available now to interested parties are time limited
licenses which allow you to use RF's full facilities for a
limited time. Please contact us if you would like to try
RF.

The update is an interim update to add some requested features
and fix some bugs. A major upgrade (1.2) containing many new
features will be available in about four months.

If you have any questions please contact academic@onthenet.com.au

Icom rarely makes bad radios, but this model was one exception! Yes, the PLL had a history of unlocking, with corresponding display segment wierdness.

The problem centered around their use of brass eyelets used as feedthroughs on the double-sided PLL board. I fixed my own by using the recommended COPPER wire jumpers at every eyelet. As I recall, there were two or three under the 40-pin PLL chip! :(Between the myriad of little wires connecting the PLL module and having to remove the PLL chip to get underneath, I had my work cut out that evening!

Icom realized soon enough that brass and lead/tin solder make little batteries that eventually corrode and open their connections!

They also recommended replacing all the polystyrene capacitors on the PLL board, as well. Back in the mid-80s when I went through this horrifying task, Icom was kind enough to send me a handful of replacement caps.

Good luck! (and no, I won't do it for you!!) :)

I have bought a few things through internet postings with no
complaints. However, there is a difference dealing with individuals
rather than companies, and that is the use of credit cards. I would
NEVER send a check to a company for a mail order purchase in advance
of receiving the goods. The credit card gives you the abililty to get
your money back if the goods are refused. The only real solution to me
is to use COD. While some decry the delay in receiving payment, it
seems the only way to make sure both parties get what they expect.
There have been a number of postings as to which carrier does the best
at returning payment, but for me it's COD or no sale. If you really
want to buy/sell, it's cheap insurance. Too bad we can't trust each
other, but being in business myself, I have been shafted by the best
of 'em.

Now what was it you wanted to sell?

73,
Phil

1721. COAX SEAL removal

Newsgroup: rec.radio.amateur.equipment
Date: 1996-11-01 00:00:00 UTC
From: Jim Brady <brady_jim@tandem.com>
Message-ID: <327A956B.2AE3@tandem.com>
Source record: 191583

Hi,
Does anyone know a solvent that can be used to remove COAX SEAL.
I have used this on stranded copper wire. Years later, the wires show
no sign of oxidation, BUT, this stuff is very hard to remove! I
have tried to find a solvent, but so far NO LUCK.
Thanks,
jim brady brady_jim@tandem.com

1722. Re: FT50r: VC23 Headset's VOX

Mystery Solved!

I stopped by HRO so I could give them my paycheck. :)
Some entered with an FT50r-said his VOX VC23 worked fine.
Soooooo, we tried the VC23s: 3 out of 4 in the shop failed to xmit by
VOX, BUT the 4th worked perfectly on all 50Rs
Thanks to Phil of 4Seasons for letting us try these on his 50r
and to Mark of HRO for standing behind his products. Mark is sending the
bad 3 back to Yaesu.
Thanks to all who replied,
73,
Steve

I bought Eugene Rippen's "Ham Price Guide" but am sorry to say it wasn't worth the money. As an example, it lists 26 prices for a Ken TS830S ranging from $400 to $900. Features of the gear are not indicated, except in vague and minimalist terms. The ARRL Radio Buyers Sourcebook is much better. It tells you the features of the gear in great detail, but does not give used prices (original price range often given.) -Dan, K8JWR

I use a large loop with very good results on all bands..
160-6m I made no attempt to get the size just right
I just put up about 530 feet of wire and fed it with 450 ohm ladder
line...
into a 9 to 1 balun to a tuner. It is up about 75 feet and puts out a
large signal. As you might expect it works best for close in stuff
on 160 and 80 although I have worked europe with just 100 W.

Never had any problems. I usually exchange email with the seller
and these messages tell quite a lot. Dishonest "sellers" don't
tell you more details than have been posted before, but the
people who really sell things can describe them quite accurately.
They will probably tell you why they are selling.
Ask questions about the item for sale and check other sources
for confirmation. If they don't match...

As far as I can tell in actual working conditions, this is more of a theoretical limitation than an actual one. In the CQWW SSB contest last weekend, a real-life acid test if ever there was one, I listened carefully for the supposed IF blowby and diminished dynamic range caused by stong signals in the IF passband. I really couldn't hear any degradation, and I did try. My feeling is that the advantages of the variable IF filters done in DSP far outweigh any slight dynamic blocking which does occur under absolute worst-case conditions.

I'm not a DSP evangelist, but I did decide to try a TS-870 to see how well it could do against some of my older analog gear, including a TS-850, which is a fine radio equipped with all the optional filters. I have to tell you that, IMHO, the 870 is better on receive. Other benchmarks include a Watkins-Johnson HF-1000A, various older Yaesu radios, and lots of Collins stuff. Of course, I think that the Collins audio is still better than all these radios, but the TS-870 is very close :-). I did demo both the FT-1000MP and the IC-775 briefly before deciding on the TS-870. I remain of the opinion that its DSP implementation is the best of the current lot.

As always, YMMV, etc.

Message-ID: <NEWTNews.846886858.1876.Pbutterf@butter-pc.ess.mc.xerox.com>
Source record: 191593

I am having a problem with my Kenwood TM-742. I am hearing an S3 signal on 146.525 MHz that seems to be internally generated. It remains constant with or without an antenna connected.

I can also hear it if I hold another receiver (e.g. an HT) nearby the 742 and tune to 146.525. I can make the signal come and go on the HT by turning the 742 on and off.

While I find this really annoying (It is still quite strong on 146.52 nat'l simplex freq!) and am likely to ask Kenwood to fix it, I am curious if others are experiencing the problem. Anyone?

I had one that I had to install many many jumpers to correct the PLL problems. It was a VERY well documented problem with the 245 and also to a degree the base version, the 211. Internationl radio Icom newsletters had an article yeares ago with all jumpers that needed to be installed. After I did mine, I never had another problem with it. I do not have the article any longer, but someone may have copies of the International Radio Newsletters.

Bob:

I am also getting into GMRS and found a good web site on the subject.
The company is called S-COMM and their url is: http://www.gmrs.com

I have not done business with them yet, but they have a good FAQ on GMRS.

Another FAQ is located at http://www.li.net/~j4dice/scanning_info/gmrsfaq.html

Yet another FAQ is http://www.primenet.com/~n7ory/gmrs.html

You will need FCC form 574 and license fee form 1070Q. I obtained these free
of charge from the FCC by dialing their forms request line at 1(800)418-3676
it is an automated voice mail system. It took about 5 days to get the forms.

I called them last Monday, and the forms arrived on Saturday.
Now I just need to get them filled out!

I hope this helps!

>a pig in a poke....comments?

It's no different than buying from a magazine ad. You pays your money
and you takes your chances. People do indeed get cheated buying over
the internet, but not nearly as often as you might think. And when it
does happen, the person's name who did the cheating gets plastered all
over the net.

If you use a POSTAL money order to pay, bought at the US Post Office,
and you don't get the equipment you ordered, it becomes MAIL FRAUD and
the post office will go after the scumbag who cheated you.

I've been buying/selling over the net for a long time and have never
been cheated.

Just curious...

What if I am running TCP/IP packet radio to connect two
LINUX boxes and a PGP-encrypted file goes across? Illegal?

What if I am accessing a remote network device and I
have no control over what is in the file? Can I help
it if somebody ELSE encrypted it? I was just moving it...
I cannot know what is in the file until I transfer it. ;-)

Don't ya just LOVE old fashioned regulations when they
collide with new technology?

Hello Mike:
I use a full wave horizontal loop on 160 thru 10 meters. Full wave
lenght on 80 meters. It is 250 foot long. It is not a true loop because
it is open on far end. It works fantastic on all bands. My rig is a
Yaesu FT-890 with a internal antenna tuner. It will tune all bands on
this antenna and WORK. And work pretty good. I have used a G5RV but it
would not radiate very well on 160. The only problem with loop is it
takes four supports, witch I have. By the way I feed it with coax and no
balun. You will probly get arguments on this arrangement, but it works.

I believe the reason that field programmable radios are not
manufactured for commercial use is that unlike the ham bands ANY work
on the TX side (including programming) must be done by a licensed
person.

Suggest a Motorola Sabre (12 Ch) or Sabre One (48 Ch). My Sabre works
both vhf ham and vhf emergency band LEGALLY. Try the group REC. RADIO.
SWAP for prices.

THIS IS THE FAIREST MOST HONEST WAY I KNOW TO

SHARE THE WEALTH! Hi there!

Question: would you like to make thousands of dollars,

quick, legally, with NO CATCH? If Yes, then keep reading. Please

take five minutes to read this article. It will change your life, just

like it did mine. If you're not interested, I apologize for wasting your

time.

It's true! You can make up to or over $50,000 dollars in 4-6

weeks, maybe sooner! I SWEAR I'M NOT LYING TO YOU, AND

THIS IS NOT A SCAM! Interested? Then here we go.

A little while back, I was browsing through these

newsgroups, just like you are now, and came across an article

similar to this one, which said; "You could make thousands of

dollars in weeks with an initial investment of only $5!" So, I thought,

"Yeah, right, must be a scam!"... ...but like most of us I was

curious. So, I kept reading.

It said you send $1 to each of the 5 names and addresses stated in

the article. You then place your own name and address in the

article at the bottom of the list at #5, and post the article in at least

200 newsgroups (there are thousands). No catch, that was it!

So I thought it over, talked to a couple of people about the

whole thing. I figured what have I got to lose except for 5

stamps and $5? So, I tried it.

Well, guess what...within 7 days, I started getting money in

the mail! I was shocked! I figured it would end soon, and didn't

give it another thought. But the money kept coming IN, tripling in size and multiplying by 10-20 times the amount that I got the first week! In my first week I made a total of over $1,000!!!! In the third week, I had over $10,000 dollars, and it's still growing. This is my fourth week (Oct 28) and I've made about $42,000 TOTAL, and the money is still coming in.....

Let me tell you how this works and more importantly, WHY it works. Make sure you print a copy of this article NOW, so you can use the information from it, and begin making money.

The process is very simple, and it consists of 3 EASY steps:

STEP 1: Get 5 pieces of paper and write the following on each sheet of paper..."PLEASE PUT ME ON YOUR MAILING LIST." Fold each piece of paper in half. Take five $1 bills and place ONE in each piece of paper. Then put each piece of paper in to it's own envelope and seal it. You should now have 5 sealed envelopes , EACH containing a piece of paper AND a $1 bill inside the folded paper. Make sure the words ..."PLEASE PUT ME ON YOUR MAILING LIST." are written on each piece paper. By doing that, you are creating a service and it's PERFECTLY LEGAL.

Finally, mail 1 envelope to 1 of the following 5 addresses:

1. S. Shaw, 611 23rd St., Sacramento, CA 95816
2. G.Charters,5809 Hudson St., Vancouver, B.C. Canada V6M 2Z2
3. D.Miller, 26 Aristone Dr., Berlin, NJ 08009
4. B.Peale, 1619 Nth 5th St., Perkasie, PA 18944
5. D.Watson, 2430 W.Territorial Rd., Battle Creek, MI 49015

STEP 2: Now take the #1 name off the list that you see above, move the other 4 names up (5 becoming 4, 4 becoming 3, etc..) and put YOUR NAME as number 5 on the list.

STEP 3: Post your amended article (with you name at #5)
to at least 200 news groups (I think there are close to 18,000 of them). This is easy to do. You can either type out this message (altering any part you deem worthy, EXCEPT the name and addresses) with an ordinary editor or with your web browser's 'To:News' key at the upper left corner of this screen (Netscape Navigator 3.0). After typing this article, save a copy. Any time you want to post this article on a newsgroup, just use a flashy subject and post your saved copy. That's it, easy! Now, post the message to at least 200 DIFFERENT newsgroups. 200 IS THE MINIMUM. The more you post, the more money you will make. You are now in the mail order business and will start receiving your $1 envelopes from various people all over the world within days.
HINT: THE MORE NEWSGROUPS YOU POST TO, THE MORE MONEY YOU WILL MAKE. You may even want to rent a PO Box, eventually because of all the mail. If you wish to stay anonymous, you can come up with a name, such as "manager" or "investor." Please be sure to check that all the addresses on the envelopes are correct.

.
LET ME TELL YOU WHY THIS SYSTEM WORKS!!!
Out of every 200 postings, let's say I ONLY receive 5 replies, which is actually VERY LOW. So I made 5 dollars with my #5. Now then, each person who just sent me $1 makes, say only 200 POSTINGS, now with your name at number 4, WHICH IS A TOTAL OF 1000 POSTINGS, not including yours too. 50 people send you $1 now; that's $50 you just made! Now, then your new 50 agents post 200 each with YOUR NAME AT NUMBER 3, OR 10,000 POSTING (50x200). Average return is 500 at $1 each is $500. They make 200 postings, which is 5,000 returns at $1 each, which

is $5,000 dollars! And finally, 5000 people make 200 postings
each with YOUR NAME AT NUMBER 1. YOU NOW GET A
RETURN OF $50,000 BEFORE YOUR NAME DROPS OFF
THE LIST. AND THAT'S IF EVERYONE MAKES 200 POSTINGS
ONLY, AND IF ONLY 5 PERSONS RESPOND!!!!!
When your name is no longer on the list, you just take the
latest posting that is appearing in the newsgroups, and SEND OUT
ANOTHER $5 TO THE NAMES ON THE LIST, PUTTING YOUR
NAME AT 5 AGAIN. And start posting again. The thing to
remember is, do you realize that THOUSANDS OF PEOPLE ALL
OVER THE WORLD ARE JOINING THE INTERNET AND
READING THESE ARTICLES EVERY DAY, JUST LIKE YOU ARE
RIGHT NOW!!! So can you afford $5 dollars and see if it really
works? I think so....
People have said, "What if the plan is played out and no sends
the money?" So what! What are the chances of that happening
when there are TONS OF NEW HONEST USERS AND NEW
HONEST PEOLE who are joining the Internet and newsgroups
everyday and are willing to give it a try?
Estimates are at 20,000 to 50,000 new users, every day, with
THOUSANDS of those joining the actual Internet. Remember, play
FAIRLY and HONESTLY and this WILL WORK, I PROMISE YOU!!!
Honesty is the key, and the best policy. Make sure you print this
article out RIGHT NOW, also, try to keep an eye on the
newsgroups to make sure everyone is playing fairly.
REMEMBER, HONESTY IS THE BEST POLICY. YOU DON'T
NEED TO CHEAT THE BASIC IDEA TO MAKE MONEY!! GOOD
LUCK TO ALL AND PLEASE PLAY FAIRLY AND YOU WILL
REAP THE HUGE REWARDS FROM THIS, WHICH IS TONS OF
EXTRA CASH!!!
<< By the way, if you try to deceive people by posting the

messages with your name on the list and not sending the money to

the people already on the list, you'd be wasting your time.

I talked to someone who did that and only made $150 dollars, and

that was AFTER seven or eight weeks! He decided to send the 5

$1 bills, and in 4-5 weeks, he had over $10K. >>

THIS IS THE FAIREST AND MOST HONEST WAY I HAVE EVER SEEN TO SHARE THE WEALTH OF THE WORLD WITHOUT COSTING ANYTHING BUT OUR TIME!!

GOOD LUCK!

I have been to a Kenwood semminar on the 570 and it looks like a very good rig. It is full QSK and has excelent CW wave shapping as seen on a scope (best I have seen) It is easy to operate with a unclutered and open internal design. Also uses a solid state antenna tuner. The DSPin this unit is AF and works very good. In fact it works as well or better than rigs costing twice as much. You can proccess xmit audio as well and mimic the TS-850s high boost too. I think they have a winner

> >Are we dead in design and production of a really leading edge product
> >for hams? I'm not only talking VHF, but HF as well.
> >

Well, if you want a R-A-D-I-O --- you know, a radio, ...as competent as anything produced in Japan, then look at the Ten-Tec HF products.

If by "leading edge" you mean a computer system, packaged with a radio as an add-on, all wrapped up in a box that looks like a leftover from the VCR production line across the hall, then ... no, you won't find a US-made product that competes. And fortunately, I don't think Ten-Tec products have a "game mode", either.

I guess its all in what you want to pay for. The bells and whistles cost money, too -- and don't help you or the other guy sound any more intelligent on the air than a simple, straightforward, sound RF (RF -- hmmm, isn't that what radio is?) design.

Bells and whistles do not a R-A-D-I-O make ... or something like that :-)

1764. Re: BUYING/SELLING QUESTION

Newsgroup: rec.radio.amateur.equipment
Date: 1996-11-01 00:00:00 UTC
From: ki0dz@juno.COM
Message-ID: <19961101.090550.3214.0.ki0dz@juno.com>
Source record: 191770

ragreen@ix.netcom.com asked about the risk of buying and selling items such as radio equipment on Internet. I agree that it is risky. Not only do you not know if, after sending your check, you'll ever get the item. But you also don't know if it'll work. Because the transaction is not face-to-face and the item cannot be taken for a test drive I know several folks who will not buy from Internet postings.

That said I contend that buying or selling items through Internet is really no different than using a magazine. The situation is the same. You may see something advertized and be interested, but the guy selling lives 1000 miles away. If you're interested you could call him up and talk to him about the piece of equipment and try to determine how honest he is. With Internet you can at least e-mail him or even call him when you get his phone number. The homework's the same it's just that the way it's done is different.

Magazine examples: In 1983 I bought a Yaesu FRG-7700 from a magazine advertisement. I put my check in the mail for $350 (I think that's the amount). The radio arrived safe and sound and is still in use. Earlier this year I sold a Microlog AIR-1 through a magazine. When I got the check from the buyer I promptly sent the AIR-1.

Internet examples: This year I purchased a Kenwood TM-733A and Yaesu FT-51R through Internet advertisements. I'm now considering purchasing a speaker/microphone from an Internet ad. Both the Kenwood and Yaesu arrived in great shape and work fine.

In concluding, I would agree with R. A. Green that there is a risk from buying from Internet. But, I don't think the risk is really any different than buying from a magazine ad. While I imagine that there are some unsatisfied "customers" out there, I have been very pleased with my purchases from both magazines as well as Internet.

>anyone who has one . With base and mobile use in mind

I have a DX-70T in my truck. I like the rig. It performs well for mobile use, except for the noise blanker, which is completely worthless. Alinco has improved the design (my rig is a very early one) but I hear it's still not much good. The big LCD display is easy to read. I've received a lot of praise on the transmitted audio quality. This is the only mobile HF rig I've ever used that does not require an external speaker, because its audio output is really super. The filtering leaves a lot to be desired. The skirts aren't steep enough. The CW filters are nearly worthless (to a dedicated CW operator who is used to operating rigs like my TS-870S). The price is right, it's plenty small for mobile use, and overall performs well. Like all rigs, it has its good and bad points.

Check QST and 73 magazines for their reviews of the DX-70T also.

I live in New York and in NY. you can find almost anything in the world that you want. EXCEPT good ham radio equipment. I also think Barry's is the worst store in the world to buy ham equipment from. Before I was licensed, I went there to see if they had any used equipment. They told me that Hams never got rid of their used equipment unless it was broken. (Hah!) They wanted to sell me new overpriced equipment only. Why not take advantage of a new and inexperienced ham...

I agree you must be unlucky. My DX70 had high deviation on 10m PL tones,
but that was the only problem I have heard of from a few other owners.
Good luck. By the way, in the case of high deviation, I returned the
unit to Alinco and they adjusted it and returned it to me promptly.

Paul.

I bought a second ft-50 sn#6I08XXXX I spent all day triing to mod it,
using the method I posted a week ago. It wouldn't work.
Finally I found somthing very cool. I removed solder blob jumper #1 And
the first resister in a row of five, above jumpers 1 2 3.
made templete,meged a data file downloaded with a dead battery. THe
download failed at 19%. powerup with knob&lamp. vfo should display 144.000 powerup with
lamp/ptt/knob held down. It should now be in
tune mode with something new (BAND)change it with the knob to FREE
(BAND=FREE) turn it off and back on NOW RADIO DISPLAYS 50~540 590~1000 (Dont mess
around you could screw up alot of adjustments here)
no gaps!!! IT will tx where ever it locks. Mine 122~231 fm 309~502.
Tx is only miliwatts near the edges (DONT TX OUT OF BAND!!!)
rx locks after about 74mhz. it is very def in the 220 band tx is miliwatts. no tx above
502. My radio is a new version "unmodifiable unit"
HA HA Thanks again yaesu.
Good luck, please post your results...
Alan

1780. Need Alinco DR1200 schematic

From: luvautm@vnet.net
Message-ID: <luvautm.113.327B774E@vnet.net>
Source record: 191489

Greetings All,
As I am anxiously awaiting my ham ticket and have already purchased a 2 meter radio that I intend to use as a mobile unit in my vehicle, I was wondering if anyone could give me advice on any glass mount antennas on the market?
I would prefer not to do any drilling on my vehicle and would like to know if a glass mount would be a reasonable option.
Is there more signal loss w/ a glass mount?
Will the thru-glass mount effect gain?
Other options I might not know of?
Any help will be greatly appreciated.
Thanx! James

Nope. Often as I screw up, I managed to say what I meant this time. But the 50 ohm SWR meter would also read 1.5:1 for any length of cable if the cable were 75 ohms. (Of course the SWR on the cable is 1:1 in this case, not 1.5:1 as it would be if the cable were 50 ohms.)

In SSB mode the 9130 runs on high power all the time. The hi-lo power
switch is made inactive by a transistor wired across it that shorts it out.
I disbled the action of that transistor by removing one pin from one of
the connectors. The hi-lo switch then works on SSB, giving you 5 watts
lo, 25 watts high.

I don't remember the pin/connector. Check the schematic for a transistor
across the hi-lo switch.

ISDN _is_ available. It is possible to get ISDN from a digital
through an analogue switchboard to _any_ phone. This is being
done here in Germany for companies that really need ISDN but
are connected to an old strowger switch <sp?>.

Just ask you local phone company. If call-waiting, caller-ID,
tone dialling,... are available, you are connected to a
digital switchboard which also supports ISDN, so don't fall
for their lies.

Just my $.02,

I have a very loud FT1000D fan - louder than the TL-922 next to it.
Yaesu said it was within specs. Apparently the fans vary in noise
level as other FT1000D's that I have operated are quite quite.

John K1FWF

If the DSP is in the AF rather than the IF, then the unit really isn't any
better, from a DSP perspective, than say, a TS450 with a good outboard
DSP unit. Am I right?

While the original 245SSB I owned never had a provlem, the nostalgia
piece I bought recently does. It came back from Icom OK but I had to
tune above 147 to get the PLL to lock. I fixed that, now a year on the
shelf and it is free running again. There is NO service manual. Guess
it's just a poor design from the early days of PLL's

I'm intrigued and a little worried to hear you say that the FT50 is a "nice radio". I was using an FT208 for some years and the FT50 was it's direct replacement. As I use the new radio in exactly the same place for the same job, I think I can compare the two without any instruments or graphs... My assessment is that the radio is as deaf as a post! Performance seems to have been sacrificed at the expense of bells and whistles. My wife, who usually keeps in touch when she's in the family car, is demanding that I get rid of the thing - calling it [not me] a useless lump! I think that both my old IC2e and the old Yaesu FT208 knocked my new radio in to a cocked hat for receive sensitivity and the 'steam radio' section of the thing sounds awful - Oh dear, what ever convinced me to buy one of these little gizmo's? Ken-G4MPQ/Dinah-G7BIK [before anyone comments about my wife using the radio in the car...}

Source record: 191551

I've used this model for a few years and have had not the slightest problem with it. It's a fine antenna with lots of gain and the SWR curve is just about as advertised. Previously I had 2 and 3 element quads up here but I just couldn't keep them in the air for more than a season, but the TH5 Mark 2 has taken everything without a murmur of protest. It sees to be the equivalent of 4 elements on each band and is useable throughout the range. If I had one minor criticism, it would be that the brace holding the balun to the boom is not made of stainless steel, whereas everything else seems to be! Maybe an oversight, but the metal there is sure rusting... I still think you'll love this one though! de Ken/G4MPQ

>check it out, and give me your feedback...

My only negative comments are:

1) No pricing information. Why not? When customers go to the trouble of finding a website, the pricing should already be there. Why not put it there???

2) Why not allow customers to purchase from the website? Many people are not as hung up on security as others. Besides, netscape 3.0 is secure enough for most people.

Lot's of postives. Nice products (the 'best' of course!)

1813. Need advice on rotator R&R

Newsgroup: rec.radio.amateur.equipment
Date: 1996-11-02 00:00:00 UTC
From: Stan Huntting <stan@mutadv.com>
Message-ID: <01bbc8df$f7963860$046085cc@stan.csn.net>
Source record: 191554
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.dx,rec.radio.amateur.equipment,rec.radio.amateur.misc

I live near Boulder, Colorado, where the BIG winds blow.

Last week's big wind got my rotator - it behaves as
though a lot of teeth are missing from the final drive
gear. HyGain offers great support, but I think that
starts AFTER I get the rotator off the tower. Now, I
need help with the task of removing it for repair.

The rotator is a HyGain HDR-300 on a Rohn 55G tower.
It mounts to the bottom of a mounting plate, which is
about 6' below the thrust bearing. Assuming the hex set
screws for the clamp (above the mounting plate) will
release, dropping the rotator out should be as simple
as removing the four bolts which attach it to the
mounting plate. The 55G is big enough to get the
rotator in and out through the side of the tower.

My big concern is this: even though the weight of the
2-1/2" diam mast and antenna (combined weight of about
250 lb.., mostly ABOVE the thrust bearing) is born by
the thrust bearing, I think the rotator is essential
for lateral stability of the mast - I don't think the
thrust bearing can maintain the vertical alignment of
the mast by itself. Am I right? Is there a standard way
of stabilizing the lower end of the mast while the
rotator is removed and repaired (likely to be many
weeks)? I'd really rather not remove and reinstall the
antenna and mast.

Also, if the hex set screws that fix the mast clamp
to the rotator output shaft are really frozen, what are
the methods (in order of increasing desperation) for
dealing with them - liquid wrench, EZ-out?

Thanks for suggestions.

Stan

Source record: 191556

Hi All,

I'm in the process of getting some ideas together for building a 2m/70cm SAT station here at home.

What I need to know is what radios are best suited to this type of operation.

I like the Icom IC821H, but don't really know what others there are around, especially since there are so many.

If you use a particular radio for SAT work, then please do E-Mail with your experience of the equipment that you are using.

I do like Icom equipment, however if there is something out there that is just as well suited or even better then I'd like to know!

*The same goes for antennas and preamps!!)

Please reply with any comments ...

1821. Re: Comments on Kwood TS-570 ?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-11-02 00:00:00 UTC
From: n4lq@iglou.com
Message-ID: <E08vGs.Iq0@iglou.com>
Source record: 191562

From my conversation with TS-570 owners, I understand the 570 is not using DSP like the TS-870. The 870 uses an 11mhz dsp I.F stage after the last RF type IF amplifier which has a 3kc xtal filter in it's chain.

The 570 has a typical audio type dsp after the detector. The IF stage has a 500hz cw filter that is switched in when in cw mode.

IF this is true, and again, it's secondhand information, the 570 is rather typical in nature and should not perfrom any better than say a TS-450 with an outboard dsp unit such as the MFJ or Timewave. Furthermore, having just a 500hz filter seems to be rather limiting.

Message-ID: <01bbc8f5$a9a7a6a0$6f1eb3c7@kiwi>
Source record: 191566

Hi folks,
I recently converted my IC-02A from 12.5/25 kHz spacing, to 5/10 hKz spacing
for use in the US, and now it won't transmit and seems to be operating on some
funny frequency.

I got the conversion info in the form of "remove this diode and add that diode",
and would like a definitive list of what all the little diodes do, so I can set it
up properly. I suspect I have only half the conversion done. In addition, when
I put it back to 12.5/25kHz, it still wouldn't work!

Has anybody got a definitive list of the diode settings?

I have the schematic.

1827. Help With FT-1000/736-R/PK-232

Newsgroup: rec.radio.amateur.equipment
Date: 1996-11-02 00:00:00 UTC
From: jsutton@erols.com
Message-ID: <55g7v3$6ij@boursy.news.erols.com>
Source record: 191568

I am having trouble obtaining enought output from FT-1000 and FT-736R
to operate a PK-232. Audio output is being taken from fixed output
available from each unit.

1 Is there enought output to operate this way?

2 Is it possible to increase output of audio from each unit?

3 What is the required voltage input to the PK-232 and what is the
Z/

Any comments or suggestions will be much appreciated.

Kindly reply VIA E-Mail to:

Jim Sutton/AC4CZ

Kenwood th-47a 440 ht $180 OBO

This is one of the `ergonomic' designs: it's got a bit of a
curve in the back so it fits your hand better.

It has all the usual goodies: (99 memories, dtmf dialer memories,
ctcss encode & decode, page, scan, charger, rubber, battery etcetera)

I bought this unit new in september 1991. It's seen light use, so it's
in excellent shape, original box, manual, & bags. Now I have a ft530.

email preferred (znha@igs.net), phone if you want to 6-11pm EST 613 832 4014.

73, Gord.

I don't know. Is the dsp inside the agc loop? Is the agc taken from the
audio instead of the IF?

Check the Icom IC-202 and IC-402. These radios are not synthesized,
but use VXO tuning. They put out a very clean (and therefore tight)
signal and the RX is very sensitive. I can't give you exact data,
but years ago I used to work portable QRP DX on 2m with an Icom
IC-202 barefoot. Add a good antenna system and you're all set
for SAT and DX.

You might want to re-tune the transceivers for SAT to get maximum
results, since they are quite narrow - I couldn't get 145.8 on
my IC-202, but received best results on 144.0-144.6 YMMV.

>An electrical 1/2 of coax is a tried and true method of mesuring
>the SWR at the antenna feed point remotely for exactly that reason.
>Its totally invisible to the remote test gear. If you doubt it try it!

You probably mean "measuring the impedance at the antenna feed point". If used for that purpose, even a small amount of coax loss can make a suprising amount of difference in the measurement. It's particularly bad if the impedance to be measured is very different from the Z0 of the half wavelength cable. Loss will cause the value looking into the line to be skewed toward the Z0 of the cable.

As for SWR measurement, consider an antenna which has exactly a 50 ohm feedpoint resistance and no reactance. Connect it to your rig with a half wavelength of 75 ohm cable, and put an SWR meter at the rig end. A 50 ohm SWR meter will read 1:1. The SWR on the cable is 1.5:1. A 75 ohm SWR meter, if you can find one, will read 1.5:1. (Actually, the meter will read a little less due to inevitable cable loss.)

How about an antenna which has a 75 ohm feedpoint resistance and no reactance, connected to the rig with a 50 ohm cable? A 50 ohm SWR meter at the rig will measure 1.5:1, regardless of the length of the coax. (Again, the actual reading will be a little less due to loss, and will decrease as the coax gets longer because then the loss gets greater.)

Source record: 191617

I have purchased four radios via the internet now. Two are TM 742a
Kenwoods , one dual band Icom HT, and one Icom 2 meter HT. All items so
far have been in the condition described, in this case all near great
condition. Only one didn't come COD, I sent the check first, and of the
others one was cash the others Company Checks. It is a chance yet there
is one thing that seems to have proven itself to be in your favor, Most
radio people are good people when it comes to doing business and dealing
with thier radios. Do you take care of your equipment? Well most of us
do too. And also if a person is so easily tracked by a call sign not to
mention represented by it, they tend to be more up front because they
can also be defaced by it. Notice that those who do wrong here are
spoken about for a long time. However there are bad seeds in every
crowd, I have just been lucky so far?
Some simple rules;

1. Speak to the person and feel them out, no keyboard to keyboard only.
(Shady people often sound that way. A phone number gives you
more info to trace before any money is exchanged.)
2. If you are concerned, ask for COD.
(Even more so if you ask the UPS or FEDEX guy to stay as you
open the box he can verify its contents and help file a claim
if you got rocks instead of what you bought. However most
won't let you open it until you give payment, and they won't
give it back usually {unless he has tape handy}. But if you are
lucky enough to be able to pay in check, you can kill it.
Money orders are good to for some extra rights.)
3. Verify information. You have a whole world at your access, make use
of it.
(Check the address of person to the call book, yet some like
myself have a different mailing address. Check phone number
to name and address.)
4. Remember that others like yourself are depending on the honesty of
some when they do choose to except a check or delayed payment
when selling items.
Higher risk gets higher benifits?
I don't know if that applies yet I think most of the people here
are on the level.
5. Last one, IF IT SEEMS TO GOOD TO BE TRUE IT PROBABLY....PROBABLY IS!

Happy shopping and good luck,
Dave Payne

I haven't run any kind of real tests on it, but I have not heard any
intermod in normal operation. I know of some hot spots around town
that would kill my HT, and they seem to be solid with the FT-8000.
I mentioned 'normal operation' because you can put a VHF freq. on the
UHF side and vica-versa. While in that operating mode, I have heard
intermod and other strange products like broadcast audio in band. I
can't be any more specific than that since I haven't had time to
experiment and fully identify the problem.
Despite an audio problem on the left side (see my previous post), I
like the radio.

Right on for getting it to work! FYI, I did NOT have the cable
removed. I did however have it replaced to see if that was the
problem.. It was then sent to Kenwood, and is at their shop now. $200
for the part ALONE. New control board. I had a friend look at it. She
had done work for NASA doing PC Boards. And she said she wouldn't have
touched it. One bajillionth of an inch, and your radio goes bye-bye.
Is opening up the frequnecy REALLY worth the risk?? I know, there's
probably a lot of people who have sucessfully completed the mod, and
just as many who had their radio fried. I unfortunately am one of the
latter.

I have two of the HTX212, the predecesor of the 242.
They are fine radios. Good features.
One thing that I am annoyed with is the fact that you cannot store
non-amateur frequencies in memory. For example, I can tune 162.550 on
the VFO but it won't let me store it in memory.
From what I've heard, the 242 fixes this problem, but don't quote me on
this. Since the 212 is discontinued, some Radio Shacks have a few left
over, so you might be able to find a close-out deal on them.

Rex,
according to the fcc, superregen receivers (especially of the old tube
variety) were removed from authorized use because they could not meet
part 15 rules and regs(created more noise in the spectrum they were
receiving on).

Hope this helps...

> ever successfully decoded DTMF tones?
>
> Tom

Mine works ok.
Go Funct 3 (puts radio in dtmf mode)
press & hold funct for 1/2 sec
press 9

any dtmf tones will be displayed, and you can scroll thru
to erase I try press and hold funct for 1/2 sec, then press the knob

you must have the ftt12 keypad for the decoding

Hope this helps
Sean

1852. Help: Icom 735 Has 20m RX Problem

Newsgroup: rec.radio.amateur.equipment
Date: 1996-11-03 00:00:00 UTC
From: leigh@rain.org
Message-ID: <55gqc5$jf2@news.rain.org>
Source record: 191491

My trusty Icom 735 has developed a RX problem on 20 meters: both SSB and CW signals sound extremely raspy. (No, I don't have any optional filters.)

Other signals on 10, 15 and 40 sound fine. (No, I have not checked the WARC bands yet.)

Any ideas where to start trouble-shooting?

Thanks in advance and 73 from Leigh Marrin/KM6JE in Santa Barbara.

You get what you pay for. Although having said that if you're only using it for CW you may be able to get by with a less expensive unit.

If you like to solder I could personally recommend the DSP kit by W9GR. It's featrued in this years ARRL Handbook and was reviewed during '95. And it sells for $175.00 with case and all. You could also save by not buying the solid steel case and build it into some other peripheral if for example you are using an outboard speaker with room in the cabinet.

Two things that make it especially wonderful for CW. It has a fantastic digital AGC circuit so that even though the rigs AGC may be tripped by a nearby powerful station within ITS passband, you won't lose the signal you're listening to within the DSP's passband.

Also you can narrow the passband very tightly without losing your side tone from your rig.

But I don't do much CW and I was blown away by how well it compensates for the mediocre receiver in my ICOM 706 on SSB. It'll turn it into a first rate rig.

Good luck and good DX.

1854. Autodialer memory

Newsgroup: rec.radio.amateur.equipment
Date: 1996-11-03 00:00:00 UTC
From: KC7MWP@juno.com

Source record: 191493

A friend just bought the FT8000R and set it up in his car. I
was very interested until he said that he could only put ONE
phone number in the autodialer memory. I haven't seen the book
yet, but is this right or is he just blind. I sure wouldn't want it if I can only have
one number.

Yes, SSB/CW/AM uses horizontal polarization, although it's not that important during band openings. (I've worked Nova Scotia, Oregon, Arizona, Panama, and Florida from Milwaukee, Wisconsin using 90w to a Diamond DP-GH62 ground plane.)

Newcomers to six meters should seriously consider buying a copy of "Six Meters: A Guide to the Magic Band" by Ken Neubeck, WB2AMU. It's available for $14 (including postage) from:

Worldradio Books
Box 189490
Sacramento, CA 95818 (California residents add 93 cents sales tax.)

It's quite a good, comprehensive introduction to the band, including equipment, antennas, band allocations, operating procedures, etc.

73,

Rick WB9GYT

Here is some more info I've come across. Apparently, It's going on
sale in the UK first:

The NEW IC-756 HF Transceiver

It looks as if Icom have produced another winner in the IC-756 to be
introduced in the UK at the Leicester (UK) show. It is hoped that we
will have one to show you then, but this cannot be promised at this
stage.

This latest transceiver from ICOM is aimed at operators who need
excellent performance and reliability at a sensible price.

The IC-756 will appeal to all users from entry level upwards and makes
an ideal base rig for all HF/50MHz entusiasts.

Features include:

Integrated 4.9in. data display
Real Band Spectrum Scope
Soft Key for assigning functions to keys
Visible Tx message on Memory Keyer.
IF DSP
Dual-Watch as Standard
CW Filter Options
Voice Synthesizer
All Usual ICOM Desk-Top Accessories

ICOM IC756 SPECIFICATIONS

General Receive frequency coverage 30 kHz - 60MHz. Specifications
guaranteed only on amateur bands.

Transmit frequency coverage Amateur Band Modes SSB, CW, AM, FM, RTTY.

Memory channels 101 with memo.

Antenna impedance 50 ohms nominal.

Frequency stability Less than +/- 200Hz from 1 min. to 60 min. after power on. After that, rate of stability change is less than +/-30Hz at +25'C.

Power supply requirement 13.8V DC +/- 15%. Current drain at 13.8V:- Transmit 20A.

Dimensions Millimeters: 340(W) x 111(H) x 285(D). Projections not included.

Weight 9.3kg,

Transmitter Output power HF & 50MHz: 5 - 100W (AM 5 - 40W)

Spurious emissions H F - better than -50 dB; 50MHz - better than -60dB.

Carrier suppression Better than 40 dB.

Unwanted sideband suppression Better than 55dB. Microphone impedance 600 ohms.

Receiver SSB, CW, AM, RTTY, FM, Quad conversion superheterodyne

Sensitivity with pre-amp on SSB, CW (for 10 dB S/N):-

1.8 - 29.9950 MHz -16dBu (pre-amp 1 on)

50 - 54 MHz -18dBu (pre-amp 2 on)

AM (for 10 dB S/N/N) 0.5- 1.799999MHz +22dBu (pre-amp off)

1.8 - 29.9950 MHz +6dBu (pre-amp 1 on)

FM (for 12 dB SINAD) 28.0 - 29.99 MHz -6dBu (pre-amp on)

50 - 54 MHz -10dBu (pre-amp 2 on)

Audio output power More than 2.0W at 10% distortion with an 8 ohm load.

Target Retail Price in the UK is about £2200 inc. VAT

I have the following radios for sale or trade for a MTSX series rack charger..

3- MT1000 VHF 150-174 16ch w/scan..comes with radio,battery,antenna,shoulder mic, leather carrying case and belt loop... $350

1- Sabre II UHF w/scan...comes with radio,battery,antenna,leather carrying case
and belt loop....$350

2- STX800 800mhz type I...with full keypad..comes with radio, battery,antenna, charger...$300

2- Syntor XX 800mhz type I,II,IIi mobiles...comes with ascessories...$200

1- Visar UHF 99ch w/DTMF...comes with radio,antenna, 2 batteries...$400

1-Kenwood Tk805D 16ch UHF mobile..field programable w/scan....$200

1- Sabre III VHF 256ch w/scan....comes with radio,2 batteries ,antenna, rapid charger and leather carrying case....$ 650

2- MTS2000 800mhz 255ch with secure...has limited keypad...comes with radio,battery,antenna, shoulder mic....Does smartnet type I,II,IIi and conventional....$650

1- STX821 enhanced....with secure..has full keypad and comes with radio,antenna,battery, and charger....$550

1-Minitor II UHF tone and voice pager..comes with pager, battery,and charger..$200

1- Maxar UHF mobile w/DTMF mic..comes with radio,mic, power cable..$200

2- MX340 VHF 2ch portables..comes with radio and battery.....$50

Please email with any possible trades or if you have any questions,please refer to which radio when you reply..Thanx

Thanx,
JOE

1865. FT50R FREEBAND MOD WORKS on ALL

Newsgroup: rec.radio.amateur.equipment
Date: 1996-11-03 00:00:00 UTC
From: "E. Scott Sykes" <flashnet@erols.com>
Message-ID: <327D0C36.38A9@erols.com>
Source record: 191504

This mod is a new mod as of 11/3/96

YAESU FT-50R Expanded Transmit 120-230, 315-505 MHz [FREEBAND MODIFICATION]

1. Remove battery
2. Remove the Ni-Cd sticker
3. Slowly lift off the keypad and carefully locate the jumper pads
4. Locate and unsolder jumper number "1" (see picture below) it is a solder blob between 2 pads.
5. Locate and unsolder surface mount resistor "A" (see picture below) be carefull! It is the first resistor on the from left
6. Reinstall the keypad with the two screws
7. Turn radio off
8. Press down and hold the tuning knob and lamp button while turning on the radio.

VIEW: looking down with keypad removed

```
*** ***
= ***** * ***
I ********************
* ---------------- *
I* | [FREEBANDER] | *
I* | _____________ | *
* YAESU *
I* ================ *
I* ================ *
* ================ *
* ========== *
* *
* ---------------- *
* | ABCDE | *
* | IIIII | *
* | : : : | *
* | 1 2 3 | *
* ---------------- *
********************
```

10. The vfo should display 144.000 Press FW. (this step may not be needed but it worked for me)

Power off.

11. Powerup with lamp/ptt/knob held down. It should now be in tune mode with something new (BAND= A 1) change it pressing the knob for 1/2 second and then turn the knob to FREE. (BAND=FREE)
12. Power off and back on NOW RADIO DISPLAYS 50~540 590~1000 no gaps!!!

(Dont change any other function or you could screw up alot of adjustments here)

IT will tx where ever it locks. One radio 122~231 and 309~502 and another radio was 120-232mhz and 315-509mhz. This varies radio by radio.

Tx is only miliwatts near the edges (DONT TX OUT OF BAND!!!).
Rx locks after about 74mhz. it is very def in the 220 band tx is miliwatts. no tx above 502 but varies radio by radio.

13. If you have the ADMS 1 software you should have a copy of what was in your radio.before you
started.
14. Copy from the radio. Save and name this file FREEBAND. This is to be saved as a clean copy for
future use.
15. Copy from the radio again (or just copy the file) name this file MERGE.
16. Merge the old file to this file and send to radio.
17. With your palms facing forward put your thumbs in your ears, wiggle your fingers and stick
out your tongue at your Users manual while it is open to page 10.
18. Then update page 10.

Dont make the FCC and Yaesu angry at you by trasmitting where you are not supposed to.

This information came from a Newsgroup message by Alan Judd, information gained from the Web Page at
http://members.gnn.com/hca/ft50/index.htm and my own attempts at restoring the radio using this
FREEBAND Mod.
Please give Alan Judd great thanks for subjecting his radio to T&E R&D (trial and error research and
development).

I picked up a Diamond SRH519 from HRO after the salesman demonstrated that it was a better antenna by comparing its reception over that of the Yaesu supplied antenna. It's not cheap, $34.95, but it does seem to work well. IMHO it looks better than Yaesu's antenna, but that's just an opinion!

> one more thing, does anyone know where the best deal is for the ft-50?
> it seems as though all the places (hro, AES) have the same prices.

> insead of HRO, AES etc. (mabey thats you)

HRO prices are pretty good, but I have beaten them on occasion at Texas Towers. You might give them a try. I didn't, because the FT-50R was definitely an impulse buy!

-I recently purchased a 2m linear amp by motorola. My question now is this,
-does anyone know what the orientation of the power plugs is on the front
-of the unit. I know that the labelling reads "POWER - +" but I am not sure
-that that is the exact polarity of the unit. Any ideas? The pin diagram is
-shown below.
--|
--|

If it is a Motorola N1274A, the horizontal blades (nearer to the SO239s)
are ground, and the vertical ones (on the right, closer to the edge of the
case) are +. The ground pins are connected to chassis ground, so use an
ohmmeter or buzzer to check out for sure. There is a big diode hooked
up backwards across the power plug (make sure you fuse the power leads;
there is NO internal fuse), so don't get confused. Some meters, when
measuring resistance, put out opposite polarity (red = negative) so keep
that in mind.

>it could be.

Careful with them; you probably don't have a license to transmit there,
and you need a Tech or higher license for the Ramsey crap.

If the Xandi one is like the Ramsey FM-6, be very careful. It has *NO*
output filtering, and puts out spurs all over the place (every 12 MHz up
and down from the carrier and its harmonics) - assembled according to
their instructions, it is ILLEGAL to use, even with the appropriate
license.

(Note. I haven't seen the Xandi other than in their ads. When I called
and asked whether they made them on frequencies that hams are allowed to
transmit on, they trotted out the old "anyone can transmit anywhere under
100 mW" story that Nick Goss used to use. That was the old rule for the
FM broadcast band; it's now based in field strength at a certain distance
from the antenna.)

If you do have a ham license, and a *valid* use for the transmitter (no,
bugging a room won't do), look at Agrelo Engineering's transmitters. They
are great for telemetry, APRS, foxes, etc. All they need is a battery and
an ID'er (he sells voice IDers for foxes also), and they are well made,
and meet the FCC's emissions specs.

Very simple. And what you should always do when receiving a package.
Don't sign for it and don't hand over the check until you have opened
it and checked the contents. The carrier will wait. You have a right
to inspect the package. COD also pretty well guarantees that the
carrier will deliver it to the right place, in order to get the money.
Otherwise, no telling where it may get left.

Once you sign for it, you have acknowledged that you received
(accepted) the package. Many of the packages I receive in my business
come with a shipping document that clearly states it is my
responsibility to verify that the package does indeed contain what the
shipping document says it does. I can't count the times I have been
handed (but I didn't RECEIVE) packages that were incomplete, or in
fact things I didn't order at all. Most reputable businesses/vendors
will make it good if I accept something that is incorrect, but they
don't have to. Just as I don't have to return materials that were sent
to me in error, but I do.
Trust but verify...
Phil

Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.policy,rec.radio.amateur.dx,rec.radio.amateur.equipment,ec.radio.amateur.homebrew,ec.radio.amateur.space

I got my ham license through a classroom training hosted by an open 446.650 repeater's founder KJ6TQ late 1993 at Burbank Fire Dept. training center in Calif. Almost a year ago KM6NP close repeater system pop up in the same pair who claimed to be coordinated but has been trying to conquer the pair to shutdown the KJ6TQ repeater.

Mike Mercado or KM6NP, who publishes the ELECTRONIC TIMES, even installed a transmitter just for the purpose of jamming KJ6TQ operations and periodically broadcast warning to KJ6TQ repeater's users. I can't believe this person whom I considered smart must be so SICK.

Ham radio operators pride themselves in being polite. Yeah right!

1875. Icom IC-2GXAT for trade

Newsgroup: rec.radio.amateur.equipment
Date: 1996-11-03 00:00:00 UTC
From: Dave Miller <aa4df@rose.net>
Message-ID: <327D3DA1.474A@rose.net>
Source record: 191514

I have an Icom IC-2GXAT in perfect condition which I don't need. I bought it new six months ago at the LIRC Hamfest in New York because my wife and I were preparing to do extensive traveling and I wanted it in the car for emergencies, and no emergencies occurred, so it has been used only twice (to test it). It has everything that comes in the original box including the original box itself, plus the optional DC power cord for use with an external supply, the optional "cigarette-lighter" power cord/regulator for automobile use, an extra charger (third-party), the operator's manual, and it has the BP-174 battery pack for 7 watt transmitter power level.

Thing is, I'm mic-shy. I've always been pretty much exclusively a CW and RTTY operator, and not too interested in FM (or AM or SSB, for that matter!) I'd like to trade the HT for HF radio equipment. Age doesn't matter, and electrical condition really only matters to the extent that the trade value assumed is realistic for the condition involved. The physical condition should be at least fair, and units MUST be "complete".

Any offers?

The W9GR DSP is an excellent unit, and GR's a great guy.

The MFJ DSP does all of this also, and much more. It also has received very good reviews.

Either unit is excellent.

Hello Mike!

I have been working with loop for 80 metres now abt 2 months. It has been
made according the ARRL Handbook. The antenna is fed directly RG58/U and
it's up about 30 feet above the gnd. The rig and tuner is Kenwood TS-870S.
"Resonance" freq. is 3.6 MHz. Power used is 100 W.
Tuning: 1.8 MHZ - no good, too much swr.
1.9 " - poor, swr ok.
3.5 " - Swr <1.2 but lots' of rf inside the ham schack
(blinking light bulbs, some TVI)
3.6 " - exellent for 0-1500 km QRBs
3.8 " - good for 1000-2000 km, no dx antenna

7.0 " - pretty good, worked VU,7M,9M,ZS,JA (CW)
SSB (mostly Europe QSOs)
10.1 " - many DX (9M,ZS,...)
14.0 " - swr <1.2 but it doesn't work very well, the signal
shoots directly upwards (I hear almost everybody
within 1000 km range)!
18.1 " - pretty good, dx qsos possible (VU,7Z,...), my
exprerience on this band is from last sunday only.
21.0 " - tuning problems, the are spots where the swr is good
and only 20 kc up or down it changes rapidly.
```

I have only few qsos into Europe.
24.0 " - pretty good swr, no other experience.
28.0 " - " " " " ".

Probably I'have had about 10 new countries during last 2 months, most of them in cw. My favourites are 7,10 and 18 MHz and of course 3.6 for domestic qsos. Best direction for me is obviously E-SE.

I had a similar experience with them. It took 25 minutes to get a price over the phone on a Icom T7A. Then it was way overpriced (by almost $100). I don't know how this place can stay in business. I ended up driving to HRO in Delaware. It was worth the trip.

Ken Clark (ken@g4mpq.avel.co.uk) wrote:
: I'm intrigued and a little worried to hear you say that the FT50 is a
: "nice radio". I was using an FT208 for some years and the FT50 was
: it's direct replacement. As I use the new radio in exactly the same
: place for the same job, I think I can compare the two without any
: instruments or graphs... My assessment is that the radio is as deaf as
: a post! Performance seems to have been sacrificed at the expense of
: bells and whistles. My wife, who usually keeps in touch when she's in
: the family car, is demanding that I get rid of the thing - calling it
: [not me] a useless lump! I think that both my old IC2e and the old
: Yaesu FT208 knocked my new radio in to a cocked hat for receive
: sensitivity and the 'steam radio' section of the thing sounds awful -
: Oh dear, what ever convinced me to buy one of these little gizmo's?
: Ken-G4MPQ/Dinah-G7BIK [before anyone comments about my wife using the
: radio in the car...}
:
:
:

This worried me so I quickly connected mine up to a sig gen and did a
very rough and ready test. Basically I wound the level of the analyser
down to a just copyable level. Levels might be slightly out above 500MHz
as I had to swap to a non synthesised source.

Freq/MHz Level/uV
76 12.6
144 .1 as low as gen goes.
145 .1 as low as gen goes.
146 .1 as low as gen goes.
200 1.6
300 1.8
400 .13
430 .14
435 .14
440 .14
500 .13
600 126.0
700 10.0
800 8.9
900 3.2
999 112.0

Having had a ganders at the Yaesu sales blurb it quotes 0.16uV for VHF
and .18uV for UHF, so I guess mine works.

Obviously I haven't made any received noise figure measurements, but as a quick lets look and see if the radio works anything like it ought to, I think this does the job.

My Son wants to try working the MIR satellite using his W32a Icom HT.
But the frequency range doesn't allow him to transmit below 440 Mhz.
(He needs to be able to transmit in the 435-6 Mhz range) Anyone aware of
a mod for these HTs to allow this?

Thanks; Bill N9TNW

Hello group,

I need information on this radio. Its a crystal controled FM
transmitter for 2 Mtr.

I need the manual and schematics. The reson is because the radio has
problems on transmitting.

Let me tell you what happens now, I installed new crystals and ever
since that moment the oscilator stops after transmitting for +/- 4
minutes. Could the reason for this be that the crystals arn't conform
the calulation used for this radio.

Hope the here from anyone,

>
>Stay far away!

All my ham gear was bought there, when I was spending some holidays in
NY, yes, I was waiting for a lot to be attended but I got a good price
for my TS-450-SAT, a MC-60, an ASTRON power supply and a BENCHER paddle
that was sent before by mail to here, Spain, because they didn't have
got it in stock . The only thing I can not believe is how is possible
that a so big city like New York has only one ham shop!, it is
incredible, I think it would be a great deal to open another ham store,
furthermore, NY is the most visited capital in the USA, a lot of hams
from all over the world visited it.

I remember that when I visited NY I was looking for another ham store in
NY without success, then I called to CQ Magazine and a very kind man
informed me that he did not know another ham shop in NY, that man was
John Dorr K1AR (Thanks again John!).

One friend is going there next month, I need a rotor and as I supouse
there is not another ham business there still, I will buy it there.

I have a T5Mk2 and am very pleased with it. I have had 4 and 3 element
monobanders for 15 and 10 meters in the past, and I believe this antenna
can compete with the 4 element monobanders without having the need of
all the extra tower and rotor equipment.

: >PL code a repeater is using. This could be a commerical item or
: >something that I could build. An ideas?

: >TED - KC8ENM

Ted,

If your radio supports PL decode/encode, it is pretty easy to find what
PL is being used on the repeaters. Most often, the repeaters do not filter
the PL tone on the output side of the repeater. What does this mean? It
means that the PL tone is reaching your radio. Simply set your radio
for CTCSS Squelch, so that only one PL at a time is select. Then spin your
selection dial rapidly so that your radio sequences through the PL's. As soon
as the signal breaks squelch, you know the tone you've selected is the proper
PL

Now let's assume that the repeater filters the PL's from the output. Chances
are, you'll have someone within your radio's range of receiving broadcasting
on the input side of the repeater. If you have anything else rather than
a rubber ducky you should be able to pick up a signal. Do the PL search
as ssuggested above on the input side.

Too easy.

Christopher,

I picked up a Kenwood 79AD(H) a few weeks back.. It is quite an impressiv
device. It's intuitive to use. It took someone who has never touched
a ham radio before about 15 minutes to learn how to use it. THe wide-band
mod was a little difficult to do.

Over all, I'd suggest it. The Alpha-tagging, over the air cloning, and the
83 channels, as well as ease of use is great. I also considered the FT-51R
too, and I've found the Kenwood just has more features and is more attractive
than the FT-51R.

Last week we had a big windstorm and my mast broke. Down tumbled the Wilson System 2, etc. The insurance company will buy whatever I want to replace the Wilson. I'm thinking about the Cushcraft ASL-2010, 18ft boom, 20/17/15/12/10 with 6.4db gain or else the Cushcraft A4S, 18ft boom, 20/15/10 with the 40 meter kit with 9db gain.

Gain is such an iffy thing, I'm not too worried about the gain figures. I'm just wondering if anyone has tried the ASL antenna, and what would others recommend? I want to keep it under $600 or $700. (poor little old me!)

The complete part 95 rules can be found online at http://law.house.gov/cfr.htm

(yes, the last is cfr.htm 'not' cfr.html)

When you are in this web site do a search on FCC PART 95.
after the search, the index to part 95 is listed as:
PART 95 PART 95 personal Radio Services Subpart A - General Mobile Radio Service.

You will have to do a search on some of the subparts to compile the entire text.
It is not all in the same place for some reason, but I was able to piece the whole
text together.

If you want it I can e-mail it to you. I deleted the CB and R/C parts that do not
pertain directly to GMRS.

1929. Which HF for first Rig??

Newsgroup: rec.radio.amateur.equipment
Date: 1996-11-04 00:00:00 UTC
From: "Gary L. Reinsch" <greinsch@worldnet.att.net>
Message-ID: <01bbca9b$1e09a1f0$c50193cf@starion>
Source record: 191421

I am looking to enter the HF arena soon.

With four kids in college, I don't want to over-buy. In other words, I want excellent performance and quality, but don't want to spend too much cash for options that I may not appreciate until I gain more experience. I will be General and maybe Advanced by Christmas. I have little experience so far.

What products would you look at New? Used?

How much should I expect to spend?

Can a dipole be installed in a large attic that extends across the house? The antenna would be at least twenty ft. from the nearest room with people.

I would appreciate any advice.

Gary

From: bnr@universe.digex.net
Message-ID: <55ln9t$dv@news3.digex.net>
Source record: 191422

Does anyone know of a web-site that has reviews or information on various used pieces of amateur radio equipment? I know there are some books out there...it would be appreciated if you have used any of these books, could you make a recommendation. I'm a no-code tech, currently working on my code and looking for my first hf rig...I have a line from a reliable ham on a used Kenwood TS-530s, but am looking for more info and maybe something to compare it to.

Any info is appreciated...73

Okay, fine, sure, right but can it be done? Will the Vx's keypad work on
the 50R? I'm sure doing so will erase the memory of the 50R.
--
First they came for the hackers. But I never did anything
illegal with my computer, so I didn't speak up.
Then they came for the pornographers. But I thought there was
too much smut on the Internet anyway, so I didn't speak up.
Then they came for the anonymous remailers. But a lot of nasty
stuff gets sent from anon.penet.fi, so I didn't speak up.
Then they came for the encryption users. But I could never
figure out how to work PGP anyway, so I didn't speak up.
Then they came for me. And by that time there was no one left
to speak up.

1932. ICOM IC775DSP

cRiTTa66> 1) Manufacturer: DIAMOND Item : SRH-805 Description :
cRiTTa66> 2M/440/1.2 TRI-BAND HT ANT 1.75" Type Codes : Price :
cRiTTa66> $29.95

cRiTTa66> or the

cRiTTa66> SMA-501 2M/440/900 Mini w/SMA $29.95 Manufacturer: NCG
cRiTTa66> Item : SMA-501 Description : MINI HT ANT W/ SMA
cRiTTa66> CONNECTOR Type Codes : Price : $29.95

I own the short NCG/Comet SMA-501 stubby and use it on my FT-50 as my high attenuation Fox hunting antenna. I can hear the local repeaters but can not talk to them with the stubby. I consider it a receive-only antenna, and a poor receiver at that.

I also own the longer NCG/Comet SMA-3, which you did not mention. It is the best SMA duck I have thus far encountered. It far outperforms the Yaesu FT-50R's stock rubber duck, both on transmit and on receive. I highly recommend it.

The SMA-501 measures about 4 S-meter units lower than the SMA-3 on my FT-50R when listening to the same repeater. If an FT-50R's S-meter uses the standard 6 dB per S-unit (and I have no idea whether it does or not), then the SMA-501 is approximately 24 dB worse than the SMA-3 on receive in the VHF band. I have not compared the two on UHF.

While we are asking about antennas for my beloved little Yaesu FT-50R, I would love to learn of a SMA based extendible VHF 1/2 wave or dual band I could put onto my FT-50R to get better signal output. I have experimented with putting a standard BNC based extendible antenna on the end of the Yaesu SMA to BNC converter. Such a combination puts a frightening lever arm on to the little SMA connector. I fear I would tear the SMA free of the radio if I were to bump the converter plus BNC based antenna against something. So I am searching for a real SMA extendible 1/2 wave. Any pointers to manufacturers or web sites?

While we are on the subject of FT-50R antennas, has anyone tried the Antennas West idea of sticking a 19.25 inch piece of wire dangling

from the ground connection of the SMA connector to act as a ground
plane for the stick duck to work against? Did it help?

Owning a gun is one thing.
Owning a gun and using it is another.
Do the ends justify the means? It depends on the situation and application.
BTW, you don't think that every gun owners dream is to use the gun illegally do you. It's not mine
There is my logic. Having it and using it...two different things.

There is another mod that even opens more up. Find it soon at
http://members.gnn.com/hca/ft50/index.htm

Have a good day. No hard feelings

Before you go any further with this take the time to throw your radio
on a test bench and run it through it's paces in these newfound ranges
on a freq counter and a signal injector. I don't think you'll like what
you find.

YES, IT IS MOST LIKELY THE PLL RANGE ADJUSTMENTS...
THERE ARE I THINK FOUR VAR CAPS INSIDE A CAN...
THEY GET DIRTY...THEN ONE OF YOUR GROUPS OF 1OR 2 BANDS
STARTS SOUNDING THAT WAY...I JUST CLEANED THEM UP
WITH CONTACT CLEANER...THEN PUT A PIECE OF TAPE OVER
THE ACCESS PORTS , BECUASE DUST IS WHAT STARTS THE PROBLEM..
SINCE IT IS A FORCED AIR RIG...
HOPE THAT HELPS...I CAN GET MORE
DETAILED IF YOU NEED...

>
>.... and all that wide open space on 6m and 220 MHz ??...

Excuse me, 'wide open space' on 222 MHz? Then why did the last 220 SMA meeting feature a hearing due to a denial of freq. coordination to a repeater on Blue Ridge, and why were there 2 freq. coordinators on 222 MHz in So. Cal. for a while? The 222 MHz band may not be used as much as 2 meters, but it's stuffed full of repeaters. There is some room on 6m, but it's awfully noisy.

I'm not sure we can blame Mike for the mess on 446.65. He is only a pawn of SCRRBA, which apparently decided that the frequency shall not have an 'open' repeater on it. The 'warning' transmitter cites references to SCRRBA coordination, but makes no mention of possible coordination of KJ6TQ by other freq. coordination entities, so it is not accurate to say that any other repeater on the freq. is uncoordinated.

Hi Folks:

I'm in the process of writing a radio control program specific to the ICom 706. I have the information on page 39 of the 706 manual. However, I'm pretty sure there are additional commands that are not included in the manual. For example, I need to discover if there is a command I can send to the radio that will cause it to report its current frequency. I've seen programs do this, but it's not in the 706 manual.

Please let me know if you have access to more complete documentation on the interface.

Thanks

1968. RX Sony ICF-SW7600 extension frequency range

Newsgroup: rec.radio.amateur.equipment
Date: 1996-11-05 00:00:00 UTC
From: chalpm@hqlab.ico.olivetti.COM
Message-ID: <199611051252.EAA01589@mail.ucsd.edu>
Source record: 191329

My Sony ICF-SW 7600 radio (Italian version) covers the following frequency range 150-285 KHz step 3 KHz, 531-1602 KHz step 9-10 KHz selectable, 3850-26100 KHz step 5 KHz, 88-108 MHz FM step 50 KHz.

The American version of the same radio covers the LF,MF and HF frequencies with the range 150-29995 KHz. I would liKE to obtain the same HF frequency range as that available on the American version but the frequencies 1602 - 3850 KHz and 26100 - 29995 KHz are not receivable on the Italian version!

The radio is controlled by CPU, it has a PLL utility, is equipped with a keyboard and can store 10 items in memory. The receiever is 48055 and 455 KHz double version and demodulates AM and SSB.

At power on the CPU checks the jumper configuration (LW, step 9-10 KHz in MW, SW, FM). Setting the LW jumper to OFF extends the frequency range from 285 to 531 KHz, while setting the FM jumper to OFF extends the FM range from 76 to 88 MHz step 100 KHz. Setting the SW jumper to ON or OFF has no effect, the frequency range remains 3850-26100 KHz in both cases.

* Does anybody have the ICF-SW 7600 schematics?

* Does anybody know how to extend the frequency range from 1602 to 3850 KHz and 26100 to 29995 KHz?

Please send your reply to my e-mail address, as detailed below.

Thanks.

Hello !!
I've heard that Kenwood has come up with a new transceiver,
the TS-570 . Does anyone has already any info about it, or
any experience with it. I would like to know if it uses also
IF-DSP, if it comes to replace the TS-450 or the TS-850 ??
Technical details is the most important for me, but if you
know anything about prices that would be apreciated too .

OK, here's my advice (worth what you paid for it, grin)

Look around for a used TS850S/AT by Kenwood. A lot of the chaps are selling them right now to upgrade to the TS870 (foolishly, in my opinion). You can pick up a good one for around $1200. If bux are really tight, look around for other used gear, the more recent the better.

Message-ID: <327F5D87.2F32@bga.com>
Source record: 191337

Hey all;

I've got a friend that is experiencing a problem with his Shure green bullet style mic. He's using it for harmonica amplification using a Musicman guitar amp. This normally works well, but he wants to get some tube type (bluesy) preamp distortion so he's tried several inline type preamps ranging from solid state BOSS type stomp boxes to a Real Tube 12AX7 type. Every time he puts anything inline before the amp, he gets serious feedback problems. The mic is wired with a Hi Impedence phono jack. Can anyone suggest a solution or a work around. Maybe an inline transformer?

Thanks in advance for any help rendered.

Hi,

I am interested in hearing from anyone who could comment on how
susceptible the new Direct Satelite TV (the 18 inch dish system)
is to RFI from ham radio. In particular, does the dish suffer from
front end overload when subject to a nearby, legal limit (power)
station operating on the 10-80 meter bands.
I am considering getting one, but am concerned about the LNA being
overloaded.

Kark-
My expierance tells me to use the XLR connectors. With the right
cable they can handle long runs with out any noise on the audio.
Also, get the mike away from the speeker...also another note, I have
seen guys use a EQ to filter out the feedback at different freqs. It
was magic to me so don't ask me how it was done...
Good Luck

Howdy,

I replaced my TM-241A with a TM-261A after I went to the Hamvention. I have noticed that the brightness of the panel on the 261A is not nearly as good as the brightness on the 241A.

Also there is only ONE brightness level on the 261A.

Does anyone know of a mod for the 261A which will give better panel illumination?

Thanks

Message-ID: <19961105.162354.11639.0.llaflamme@juno.com>
Source record: 191351

Greetings, and thanks for reading this.
I have had this little Yaesu FT411-E for three years, it was my first ham radio.
I have really used it alot, as a base, mobile, portable, and on packet.
It is truly one of the greatest little radios that I have seen.
My problem is this: I only get audio when an external speaker/mike is plugged in. I have plugged/unplugged spkr/mic and packet cables many,many times, and now I guess I must pay the price!:-(
I have to "jiggle" the mike plug sometimes to get the audio to work, so I think the jack is getting worn out.
My question is do I dare open the radio myself to fix this? I'm OK on the HF rig (of course Ten-Tec sends the parts and instructions, bless 'em), but this radio is SMALL!! I still use the radio, but I think it's just a matter of time!
Any help appreciated.

From: rwp@primenet.com
Message-ID: <55odf0$3a6@nnrp1.news.primenet.com>
Source record: 191361

Like most FT-50R owners (it would seem), I am looking for a replacement for the stock rubber duck that comes with this fine radio. Because I already own a Comet SH-55 that I use for those situations where antenna size is not a consideration, I am really looking for the best combination of *small size* and performance.

Here is a summary of the antenna recommendations that have been made in the past -- hopefully someone who is knowledgeable about the subject can respond with advice on a clear winner. "SMA"-style connnectors are a plus.

EXY-450 dualband duck from Centurion (BNC).
SMA-3 dualband duck from Comet (SMA).
SMA501 from Comet (SMA) -- "Miracle Baby redone for SMA".
Standard C508 mini HT factory antenna replacement (SMA).
Icom FAS-2/70 (SMA).

Many thanks in advance for those who take the time to respond!

Hello ALL

I have moved my Winpack web page to a new location. It previously resided at Healey communications and it is now on Acay.

ALL files are operational including force17.zip !! I have added a TPK page to cater for the unexpected demand in TPK addons.

As always, FEEDBACK is welcome ! Hopefully with the help of N0MTH, I'll be able to add a Winpack FAQ section. I am also considering adding a TSTHOST or/and WinTnc page if there is enough demand and there are enough addons available to make it worthwhile !

New page @ www.acay.com.au/~vk2yx

If anyone is experiencing problems getting to the welcome page, try www.acay.com.au/~vk2yx/welcome.html

If you DO have problems, please e-mail me so I can let my ISP know..

Funny you should mention that. I tested a bunch of VHF and UHF FM
rigs a few years ago to find out what their S-meter characteristics
were. Turns out that all of them had a characteristic that was
approximately 1 S-meter "Bar" or "Light" = 1 or 2 dB.
So the 6dB rule clearly does not apply. Basically, what this means
is that the S-meter covers a fairly narrow range, perhaps 10 dB
or so.

Or the other hand, I checked my Kenwood TS-430 hf rig and it was
almost dead nuts on the 6 dB per S-unit curve.

Bob: If you have the Bird model 4430 with interal sample port coming out
the side. The specs from Bird catalog are "RF coupling -53db from 512MHz
to 10Mhz, decreasing to -70db between 10MHz and 2MHZ". If you have the
sampler that bolts in series with the coupler model 4275 (20-1000MHz) or
model 4273 (1.5-30MHz) the coupling is adjustable from -35db to -70db,
with quite a bit of roll off(less coupling) as you go lower in frequency.

2010. Old top-of-line or new mid-line?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-11-05 00:00:00 UTC
From: tjf@lanl.gov
Message-ID: <tjf-0511960853370001@mamie.lanl.gov>
Source record: 191371

Hi...I am getting ready to upgrade from my good ol' reliable TS-820S to a more modern rig with WARC capability. I've noticed that some of the older top-of-the-line rigs, like the Kenwood TS-940SAT (used) are selling for prices similar to newer rigs like the Kenwood TS-450SAT (used).

Getting the info on these rigs for a detailed comparison is difficult for me because some scumbags have removed selected back issues of QST from the Library.

I'd appreciate the group's comments about old vs new, top-line vs mid-line, filters, features, options, improvements, etc.

Please post, rather than email. Thanks!

For 160 ARRL Handbook suggests shorting the shield to the center
conductor and running the 80 M full wave loop as a top loaded vertical.
Did you try this? Does it actually work?

If you have a Swan tube-type transceiver, you ought to know about John Bruchey. He works for Cubic Communications, and has been repairing tube-type Swan gear since Swan (Cubic) was selling them.

I just sent him my old 500CX "SS16B Special" for a tune-up and for a vexing problem in the VFO circuit I couldn't find. It came back one week from the day I mailed it to him. He did the following: Two tubes replaced, one VFO amp coil replaced, installed a factory mod, cleaned all pots, switches, and relays, did a complete TX alignment, and did a complete RX alignment.

His charge? $135.

Wow. If you have a sick Swan, call John.

I used the CAP/MARS mod then, removing 0 ohm chip.
Got the BAND A1......E1 FREE too.

RX in different band is not continous.

A1 72 - 222 RX 122 - 222 TX
B1 222 - 229 RX 222 - 230 TX
C1 300 - 399 RX 306 - 399 TX
D1 400 - 540 RX 400 - 500 TX
E1 590 - 999 RX NO TX !

Really deaf in some spots too. Somebody recently posted a sensitivity test. I don't really have any test gear (ears, scanner only) so I can't verify squat. Will have it check with a friends IFR soon.

Using stock antenna.

>
> Greg/N5SKE

A correction -- the 8640 is not >>PHASE<< locked. It is >>FREQUENCY<<
locked. When you hit the "lock" button, it reads the frequency
counter and then steers the frequency with a varactor to keep the
same displayed number.

The really good thing with the 8640 was that its cavity controlled
oscillator had exceptional short-term stability and was very "quiet".
I rank it as an exceptionally good signal generator for amateur use!

Well, if this is true - and I have only your word for it - then something is really awry,
to the best of my knowledge and belief jamming is illegal for hams no matter what the
circumstances. I believe that even if the other station were an intruder you still must not
jam it, but rather take whatever regulatory enforcement action is open.
So in my opinion, if you have evidence that a ham is jamming then you have a duty to lodge
a formal complaint. Anyone who intentionally jams should have their license revoked.
This doesn't mean I take your side your fight over a frequency, it only means jammers
should be removed from the air. Now if he were to get up in person on the frequency,
make a two way contact and politely explain his point of view and request operators to
vacate the frequency then that would be entirely different. But broadcasting is rude and
jamming is, in my opinion, illegal.

Message-ID: <9611050658.AA33898@shani.net>
Source record: 191471

Barry Electronics is well known for many years for the worst ham store
in US. I visited ham stores from coast to coast and I wasn't able to found
one so bad.
Advice for foreign ham visitors in US: the best buy is from dealers who sell
by mail / phone / fax . Their prices are cheapest in the market because
they are selling large quantities, the service is excellent and the delivery is
very fast. I buyed for the last few years many items from AES and HRO
and never disappointed. In the most cases the delivery was free and you
don't have to pay VAT. Just make a smart buy: ask for catalogs before,
ask for other hams experience on same items, look for product reviews,
ask for detailed data sheet, check for their warranty policy and repair
facilities. Different reflectors on Internet can help you a lot before you'll
take a decision. Buying hams items in US is cheaper than Europe and
Asia - Japan included - and as far I know, they have best consumer
protection.

Message-ID: <199611050733.XAA11656@mail.ucsd.edu>
Source record: 191472

My Sony ICF-SW 7600 radio (Italian version) covers the following frequency range 150-285 KHz step 3 KHz, 531-1602 KHz step 9-10 KHz selectable, 3850-26100 KHz step 5 KHz, 88-108 MHz FM step 50 KHz.

The American version of the same radio covers the LF,MF and HF frequencies with the range 150-29995 KHz. I would liKE to obtain the same HF frequency range as that available on the American version but the frequencies 1602 - 3850 KHz and 26100 - 29995 KHz are not receivable on the Italian version!

The radio is controlled by CPU, it has a PLL utility, is equipped with a keyboard and can store 10 items in memory. The receiever is 48055 and 455 KHz double version and demodulates AM and SSB.

At power on the CPU checks the jumper configuration (LW, step 9-10 KHz in MW, SW, FM). Setting the LW jumper to OFF extends the frequency range from 285 to 531 KHz, while setting the FM jumper to OFF extends the FM range from 76 to 88 MHz step 100 KHz. Setting the SW jumper to ON or OFF has no effect, the frequency range remains 3850-26100 KHz in both cases.

* Does anybody have the ICF-SW 7600 schematics?

* Does anybody know how to extend the frequency range from 1602 to 3850 KHz and 26100 to 29995 KHz?

Please send your reply to my e-mail address, as detailed below.

Thanks.

2031. Another Tech Question - KWM2

Newsgroup: rec.radio.amateur.equipment
Date: 1996-11-06 00:00:00 UTC
From: markem@primenet.com
Message-ID: <55rfa7$l84@nnrp1.news.primenet.com>
Source record: 191225

Conrad seemed to get some good info about his KWM-2 problem, so I'll ask about mine.

Mine works fine except that the ALC voltage is much higher than spec. The manual says if it's more than -1.8v then replace the tube. Well, mine runs about -4.5v (technically, that's a lot lower than -1.8v but I'm pretty sure they mean higher in absolute value terms). Replacing the ALC tube makes no difference. This really limits the power output so much that I'm running a QRP KWM-2. If I short the ALC to ground (which is what happens in the TUNE and LOCK positions) I get lots of power out. I don't really want to run that way, tho.

Any suggestions what to check? I don't see any obvious problems (smoked components, etc.). Any advice will be greatly appreciated.

73... Mark AA7TA

I have one myself. There is only one mod and it is listed in the
operations manual regarding MAR/CAP extended frequency transmit.
Other than that, I have search high and low and come up empty handed.
After fully considering the actual use of an 'opened transmitter', I
said to mysel, "Why, all my communications are in the HAM bands". I
have not heard anything interesting in the extended receive scan mode...
so why would I want to transmit there? My rhymes and reasons may be
different than your, but the modification does not offer me anything
that I don't have.

2036. IC-706 6M Out 2M Port??

Newsgroup: rec.radio.amateur.equipment
Date: 1996-11-06 00:00:00 UTC
From: edwin bailen <n5kzw@eden.com>
Message-ID: <Pine.BSD/.3.91.961106221812.8745E-100000@matrix.eden.com>
Source record: 191230

When I ran a Hustler triband on my truck, the IC-706 tuned up quite nicely on 6 meters since the Hustler mast is cut for 6M. Unfortunately, the Hustler wasn't compatible with the trees overhanging the cow paths I drive and I had to go to a low-profile bug catcher that won't resonate on 6M.

I don't have a schematic for the IC-706. Can someone give me an idea of how (im)possible it would be to get the 6-meter signal automatically switched to the 2-meter antenna jack? I don't need the 2M output (but it would be nice to feed a pair of nested halos for 6M and 2M SSB). TIA.

In anticipation of passing my Technician Class exam at the end of this month (still learning CW!!), I've done some window shopping for a mobile 2m rig. While I've narrowed the radio search down to a Kenwood TM-733A (or equivalent), I'd greatly appreciate at this point hearing anyone's general experience & recommendations relative to manufacturers and models of power supplies that are suitable for the home use of mobile VHF gear. What should I know to be a smart buyer?

73,
Bob

2039. Uniden BC-100XLT Help

Newsgroup: rec.radio.amateur.equipment
Date: 1996-11-06 00:00:00 UTC
From: kjsmith@violin.aix.calpoly.edu
Message-ID: <55s11k$2kh1@violin.aix.calpoly.edu>
Source record: 191233
Cross-posted to: rec.radio.scanner,rec.radio.amateur.equipment

I'm attempting to revive a long-dead Uniden BC-100XLT handheld scanner. Thanks to Bob Parnass for getting me the info I needed to get the replacement part I needed.

Unfortunately, with a new battery, the scanner still has a problem. Everything works great except the audio. It's muddy and low. I suspect a bad bypass capacitor in the audio amplifier. I'm kicking myself for not ordering a service manual when I ordered the other parts, and am hoping that someone with a service manual can provide part numbers for the audio caps so I can order them along with the service manual. Or better yet, the location and value of the cap so I can attempt to replace it without going through Uniden parts..

>got it in stock

Maybe compared to what you would have paid in Spain but by American
standards, they're the highest priced dealer in the states-period.

>The only thing I can not believe is how is possible
>that a so big city like New York has only one ham shop!, it is
>incredible, I think it would be a great deal to open another ham store,
>furthermore, NY is the most visited capital in the USA, a lot of hams
>from all over the world visited it.

Well, the reason is probably this: most hams have cars and there is NO
PARKING in NYC. Why in the world would you put a ham store in a place
where there is no parking? Also, the sales tax is 8 1/2 percent whereas
in surrounding states it is less. Delaware has NO SALES TAX at all.
New Jersey, which is just next door has only 6% sales tax. Those are
just two very good reasons not to have a ham store in NY. Also,
remember the crime rate in NY is very high-best not to carry cash when
traveling in the city.

From your schematic diagram it appears that you were transmitting directly into your power supply! An inductor in series with the 12V line would have blocked RF going into ground via the power supply connection. I wouldn't recommend this configuration however. As soon as your 5/8 wave antenna contacts the body of your car, sparks are gonna fly and you'll have a nifty arc welder!

Hello and thanx for reading this message.

I have a mint condition Kenwood TM 733 2m/440 dual band
50/35 watts, with detachable face.

Included is the $100.00 separation kit, external duplexer, external
speaker, and mobile antena (dual band), new $15.00 packet data cable
(1200/9600 bps capable), original box, and manual.
I still have the registration card in the box.

I am asking $550.00 obo. I am a very motivated seller, and this would
make a great Christmas gift!

Howdy Bob --

Bird takes their customer service seriously. They're a great
corporation. Just give them a call in Solon (Cleveland) Ohio and
request an operator's manual. They will very likely send you one
cheaply or free -- just make sure to have the model number.

BTW you won't hurt your scope or counter just plug it in and go to
town.

Sorry if this is a FAQ.....

I'd like to build an automatic voice IDer to either run a fox transmitter or to call CQ on 2m FM simplex/SSB. I looked up the article in QST from April 95, but would rather have something utilizing the Radio Shack voice chips. Pointers to other resources (esp. those on the net) would be nice.

E-mail copies of responses appreciated.

I leave in Eagle Rock and always used the MARS repeater using high
power mobile rig. Lately I can't even make a call. You people are the
ones who are suppose to go to 222 MHz because those people got their
first. I too got intimimated with that QST, gave a call to one of MARS
people, it's phony. I wouldn't even give a damn to SCARA or whoever in
that Santiago Peak group. Oh well, Mr. Dengler, KE6TZF is Sunset Ridge
Repeater group. You're one of those people jamming. I was wondering
may be you people are getting a lot high power RF's being radiated
right in your head like those guys at 147.435? If you've been using
MARS 446.650, would this mess will make you happy? I should say 73 but
don't which is appropriate this time. May be KJ6TQ would no better...

Hi to everyone!

After pushing 'set' + 'band' my rig still doesn't want to go into
crossrepeat mode. I have allready did a complete CPU reset. But no go.
Is there a hardware mod I have to do ? Could anybody supply me with
one? I can't find anything at 'http://www.qrz.com'

Note:

Gary Pearce left me a note saying that I must keep the 'set' + 'band'
buttons in for at least 2 seconds. If I do this I only hear one beep
and the 'L' comes on steadily(not flashing).
Still no crossrepeat !

> 73'SI am happy to report that we now have a great little ham store in Poughkeepsie, NY. It is called Ham Central and is at 3 Neptune Road, Poughkeepsie, NY 12603. The telephone number is (914) 462-0415. If you are in the area, Neptune Road is off US Route 9 just south of the IBM Lab in Poughkeepsie. Poughkeepsie is about 2 hours by train or car from NYC.

By the way, I have no association of any kind with the store except as a customer.

2063. Re: Mobile glass mount 2m antennas?

Newsgroup: rec.radio.amateur.equipment

In article <luvautm.113.327B774E@vnet.net>, luvautm@vnet.net (James Rimmer) says:
>
>As I am anxiously awaiting my ham ticket and have already purchased a 2 meter
>radio that I intend to use as a mobile unit in my vehicle, I was wondering if
>anyone could give me advice on any glass mount antennas on the market?
>I would prefer not to do any drilling on my vehicle and would like to know if
>a glass mount would be a reasonable option.
>Is there more signal loss w/ a glass mount?
>Will the thru-glass mount effect gain?
>Other options I might not know of?
>Any help will be greatly appreciated.
>Thanx! James

I've used a glass mount (was Antenna Specialists, think they
might have changed names?) on my Taurus sine 1987. Before
that had uses a 1/4 wave trunk-lip mount and before that
a 5/8 wave trunk-lip mount. From time to time I use a 1/4
wave mag-mount on my wife's van. My experience is that the
BEST performing antenna is the roof-mounted 1/4 wave mag
mount, which I attribute to high, unobstructed location
with a wide ground plane. The closest to that was the 5/8
trunk mount. The glass mount is roughly equivalent to the
1/4 wave trunk mount. Given its higher, less obstructed
location I would assume it is a bit less effecient.

Still, it is a clean installation requiring no holes and
no coax to be pinched through trunk or door gaskets. It
is satisfactory and I plan to install another on my new
Explorer.

Good luck and welcome to the air!

2064. Re: IC-775DSP or FT-1000MP

Newsgroup: rec.radio.amateur.equipment
Date: 1996-11-06 00:00:00 UTC
From: n4lq@iglou.com
Message-ID: <E0GAHo.BDn@iglou.com>
Source record: 191289

Neither sounds all that great on cw transmitt. The MP will chirp on the first character if used full power above 20 meters and the 775 sounds pretty ragged on qsk. All the signals from 870's I've heard sound good as well as the new 570 which looks like a much better deal to me.

Seems like the manufactures generally are not concerned with how cw sounds on the other end. It's a shame to hear a $4000 rig sound like a 40 year old Knight kit built by some kid. Sure the receivers all sound good but for 4 G's shouldn't we be able to transmitt a simple cw signal that doesn't sound like mush?

Marc Illsley Clarke (mic@hpfimic.fc.hp.com) wrote:
:
: I own the short NCG/Comet SMA-501 stubby and use it on my FT-50 as my
: high attenuation Fox hunting antenna. I can hear the local repeaters
: but can not talk to them with the stubby. I consider it a
: receive-only antenna, and a poor receiver at that.
:
: I also own the longer NCG/Comet SMA-3, which you did not mention. It
: is the best SMA duck I have thus far encountered. It far outperforms
: the Yaesu FT-50R's stock rubber duck, both on transmit and on receive.
: I highly recommend it.
:

I replaced my stock FT-50R's stock rubber duck with the ICOM FA-S270A,
which is a replacement antenna for the ICOM T21A. My main concern was how
tall the stock antenna was. I was looking for something smaller to make
the radio less conspicuous and generally easier to deal with. Most of my
repeater work is close in and I have no problem hitting them. The
FA-S270A is about half the size of the stock FT-50R antenna, and even
though I have done no testing with any meters (sorry, I am still
relatively new to all this) I can say that I have noticed very little
difference in TX or RX. I got it from HRO and I remember it costing
around $24.

Good luck and 73's...

2m/440 dualbander. Transmit and receive opened up. Also receives cellular. Great radio like new condition. Always in Leather Case. 2 speaker mikes, 3 batteries (1 needs new cells), rapid charger and wall charger. Boxes and manuals. $375 incl. shipping 48 states.

2071. Tech Question - KWM2

Newsgroup: rec.radio.amateur.equipment
Date: 1996-11-06 00:00:00 UTC
From: hoff@america.com
Message-ID: <55qgti$cgh@defiant.america.com>
Source record: 191296

Hi,

The S meter reading of the crystal calibrator at the 200 position on
the VFO is 6 S units lower than at the 0 position of the VFO even
though it is peaked with the tuning control.
This also carries over to transmitting where I can't get output at the
200 position on the VFO. This is true on all bands.

Sounds like an alignment problem, but doing an alignment on one band,
80 meters, didn't help that band.

Any ideas will be greatly appreciated.

This is not true all of the manufacturers also require a sales receipt with a warranty card to establish date of sale. Without a dealer's receipt the warranty card is just another hunt of paper, makes a good book mark though.

2083. Icom IC-706 vs. Alinco DX-70

Newsgroup: rec.radio.amateur.equipment
Date: 1996-11-06 00:00:00 UTC
From: lui@netcom.com
Message-ID: <lui-0611961215010001@www.algonet.se>
Source record: 191308

I believe there was a thread about these two radios a while back, but I wasn't in the market for an HF radio then, so please pardon the request.

I'm a Tech+ now, but should be an Extra next week if I'm lucky (or at least an Advanced) and I'm in the market for an HF radio. These two particular radios interest me because they both also cover 6m (and the IC-706 covers 2m also).

I'll mainly use the radio at home, but will occasionally go mobile as well.

I wanted to get started in HF, but also experiment with 6m and maybe some satellite stuff in the future. How suitable is the IC-706 for satellite operation?

Do I really need 100 watts on 6m? (DX-70T vs. DX-70TH).

What is a good mobile antenna for either radio? What about an antenna for a limited space situation? (I live in a townhouse).

I got an updated brochure on the IC-706, and they changed the receive coverage from 30KHz to 200MHz to 30KHz to 120MHZ + 2m. Does this radio have a problem between 148MHz and 200 MHz?

Stephen

>I just read a Ten-Tec add offering a 6 meter fm transceiver kit,
>output five watts. OK. It goes on to add " (sorry, FCC rules forbid
>sales of add-on power amp) " . Since when was five watts the leagle
>limit on 6M? Anyone know whast up with that?

Five Watts is NOT the legal limit on 6m. However, the FCC will not give
type-acceptance to power amplifiers for the 6m band because it's too easy
to modify them to work on 11m CB. This is the same reason that HF amps
don't come with 10m and 12m from the factory. Licensed amateurs may buy
upgrade kits to install themselves, but the factory can't do it.

There's no law that forbids YOU, the amateur, from building a 6m amp.
Ten-Tec just can't sell you one.

I know there are a few amps on the market (Mirage, etc), but they are
grandfathered because they were on the market before the FCC ruling came
into being.

Conrad,

Check your VFO output level at that position compared to where the operation
is normal. Low output level can mean reduced power output on transmit and
reduced sensitivity on receive. Use a high-impedance voltmeter or 10X scope
probe with enough bandwidth to measure the frequency involved.

If this radio PLL is like the older 745 or R7000, it may be corrosion in the PLL trimmer caps. My 745 sometimes goes bonkers on some PLL bands. What I have to do is take an adjustment tool and turn the PLL caps trimmer caps back and forth a bi to clean up the corrosion,... care must be taken to remember where the cap was originally set.

I'm also looking to buy ft-51r or th-79 so could anyone else give more
detailed info on them, I prefere ft-51r more because it looks better it
has also backlit keypad and mic is at the bottom of the radio.
Thanks Rok

> into being.

Just about everything in the above post is totally wrong. Command Technologies, the company of Patrick N8BRA, showed a prototype of its 6m 3CX800A7 amp at Dayton this year and started shipping the units after gaining FCC approval at the end of September. There is NO restriction on gaining a Type Acceptance for a new 6m amps.

> Amateur radio operator KC5NG, Extra Class, VE (ARRL/W5YI)

What a (bad) joke. You should know how to read section 97.317 which restricts the permitted gain of HF Amplifiers only between 24Mhz and 35MHz and not between 50MHz and 54MHz.

I live in Germany and I have bought and sold a few times via the net.
When buying, I send cash first (not too much at once) and wait for
the equipment. I never had any problems this way, but I only buy
things I know, so I can verify the seller's claims before buying.

Today I picked up an IC-502 with amplifier and power supply from
customs and got what I was promised - a working radio, used but
cared for, with manuals. This neat little gadget was travelling
for about six (6) weeks, but arrived safely. Sure, there are
some dishonest people around, but they can be easily spotted
since they don't know much about the equipment they're selling.

Just my $.02,
Jens, DB9LL

Looks like the problem might be VFO out put. It remains level at about
1.5v rf from 0 to 100 on the dial and then drops gradually to 1v at
200 on the dial. Wonder how one fixes this?

>
>What products would you look at New? Used?

If you have over a thousand dollars to spend on a new rig, then your budget is already greater than mine; I doubt I'll ever get a new one. If that's the case (I'll only advise on the used market since I'm not familiar with the latest stuff) I would recommend a Kenwood TS-440S if you want a solid-state final rig and a TS-830S if you want a few more features and tube finals. If your budget is a bit smaller, more like the $500 range, I would recommend the Yaesu FT-747GX.

The FT-747 is the low-end HF rig which was discontinued a couple of years back. It has all bands, all modes, general coverage receiver (can easily be made general coverage transmitter also). No tubes in the final, that means no tuneup time. But it will operate with no problem into a 2.5:1 or even 3:1 SWR like the tube rigs will. That's an advantage over some of the early Icom and Kenwood solid state rigs which require an antenna tuner except for the most perfect 1.5:1 or so antennas. Other advantages to the FT-747: you get to play on all bands, all modes (including AM and FM) and find out for yourself what you like. It puts out at least 100w of power on all bands. And someday, when you have some experience on HF, know what bands, modes and features are most important to you and you're ready for a newer or fancier rig, the 747 makes a great mobile rig; it's small, simple and light. Yaesu is still selling parts and PC boards for the 747. Disadvantages: No speech processor, no variable noise blanker, no VOX. The frequency entry interface is awkward. And the receiver is not as sensitive as the Icoms.

>How much should I expect to spend?

You can get on the air with a 10m or 12m CB conversion and a dipole for less than $50. But if you want all bands, or even the five main HF bands, you'll spend at least $375 for the rig itself. If you choose your rig and antennas carefully you can avoid the tuners and tuned-ground devices. These days every rig comes with a mike. About all you'll need in the way of accessories is an SWR/power meter and a key. And headphones if you're too

close to the other goings-on in the house.

>Can a dipole be installed in a large attic that extends across the house?
>The antenna would be at least twenty ft. from the nearest room with people.

Yes, and that distance is not critical.

>I would appreciate any advice.

And this part is likely to get me crass messages telling me I don't know which end is up. Oh well. When you string your dipoles, you don't need a balun. You have a 50 ohm rig, a 50 ohm coax, and the impedance of your dipoles at and near resonance is close enough to call 50 ohms resistive. So just use a center insulator, and use the old 234/f formula to cut each end of the dipole. When you install them, you can put several dipoles on the same feedline, just make sure that each one is approximately straiArticle Unavailable

2097. TS-690S Tx Audio Problem w/TNC

Newsgroup: rec.radio.amateur.equipment
Date: 1996-11-06 00:00:00 UTC
From: scott <acepilot@mwt.net>
Message-ID: <32819291.60E6@mwt.net>
Source record: 191322

Anybody experience the following with the Kenwood TS-690s (and I presume the 450S would be the same):

I connect my radio to my MFJ-1278 All Mode TNC via the ACC2 (13 pin) jack provided on the back of the rig. If I am using the TNC with the radio, everything seems to work peachy. If I leave the radio connected to the TNC and use the front panel Microphone connector for SSB, I get reports of distorted audio. If I disconnect the TNC Cable, audio reports are excellent. If anyone has come across this, AND A FIX, please let me in on it. I love the radio, but connecting and disconnecting the TNC all the time SUCKS! 73, Scott, N0EDV.

2098. Which 2m FM amp to choose?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-11-06 00:00:00 UTC
From: Dave Strieter <strieted@agcs.com>
Message-ID: <3281208D.174B@agcs.com>
Source record: 191323

I'm thinking of buying a 2m FM amplifier for use with my HTX-202 handheld. There are several that I've seen that provide ~30 watts out for 2 watts in, including the Radio Shack (forgot the number), Mirage B-34 and B-34G, and RF Concepts 2-23. The B-34G adds a receive preamp to the B-34.

The questions are, does anyone have a recommendation as to which to choose? Also, is the receive preamp useful with a decent mobile antenna?

Thanks in advance.
73,
Dave

Dear Jim:

They're okay, but it really helps to have metal ground instead of
glass. Is your car's body metal? If so, use a mag mount or trunk
mount 2 meter or dual-band antenna. If not, and, you're so inclined,
have a professional trailer hitch company weld a small metal hitch
tongue to your car's chassis and mount a traditional 2 meter or dual
band antenna, behind the bumper. I've seen composite cars, like
Camaros and Corvettes, use that with great success. Also, make sure
your car's computer won't fritz when you key it up. That's a whole
'nother game altogether. Glass-mounts will work, but it's not the
same. I'd use one only as a last resort.

Steve,

Mine works just fine. The main trick to get the VOX to work is turn
off the HT before plugging in the headset, then turn the HT back on.
The PTT will work even if the radio is turned on when you plug it in.

2108. Re: Another Tech Question - Collins S-Line

Newsgroup: rec.radio.amateur.equipment
Date: 1996-11-07 00:00:00 UTC
From: U54293@uicvm.uic.edu
Message-ID: <96312.132124U54293@uicvm.uic.edu>
Source record: 191131

Ok, I'll give it a go with my collins question:

32-s1, 75s3 connected as transceiver. All seems to work, but output level is low......when I tune-up for cw, output is around 100W, when I actually use CW, output looks more like <10 watts.... While following the tune-up instructions, the part about setting the mic-gain control to get a correct ALC reading doesn't seem to work. While in SSB mode, when I hit the PTT in the mic, and the meter is in ALC mode, the meter goes backwards and reads less-than-zero (regardless of the setting of the mic-gain control).

Mic-gain does seem to have an impact on the power-output.

I wonder if I may also have some kind of ALC-related problem..since the previous post said that ALC is grounded-out during tune-up, and my power looks good at tune-up, it's only during CW or USB/LSB that power is way down.

Please help. If possible, respond by email.

thanks.

See if they will go cod with your paying cod charges up front. That
way you are assured that you will receive something. If they show
resistance to the prepaid cod, you don't need to do business with them.

2110. Re: Old top-of-line or new mid-line?

You might pick up an ARRL Source Book (I think that's what it's called).
It's a collection of QST reviews on a variety of commercial rigs. I
think there are two or three volumes out now.

2111. Collins 30S1- HV problem

Newsgroup: rec.radio.amateur.equipment
Date: 1996-11-07 00:00:00 UTC
From: Jonathan Kohn <jwkohn@wharf.ship.edu>
Message-ID: <32825165.4ADF@wharf.ship.edu>
Source record: 191134

I have a 30S1 which has an intermittent problem causing the HV to drop out. Usually it takes several tramsmissions for the problem to show up which would seem to be a thermal problem. I have bypassed the thermal switch in the air stream but the HV dropped out anyway. So I thought the problem was in the over current protection circuit - I run 1500 wt out although the problem occurs at 1000w level also. Suddenly the amp started acting normal again. Could it be dirty relay contacts? Any other suggestions? Contact me here or direct at jwkohn@wharf.ship.edu

>I have found that gasoline is a pretty good solvent for coax seal. Best
>thing is that I'm sure you already have some!

>Woody-AK2F

I would highly discourage the use of gasoline for a solvent. Gasoline
as you know is highly flamable and when you use it in an open
container or on a rag, the vapors are dense. Perfect conditions for a
n easily ignited fire. You are flurting with danger and a very
serious accident. The risk of bodily injury or property damage is not
worth the savings in time or money in not using a proper cleaning
agent that is none flameable. Nearly everybody that has been burned
by gasoline said they were being careful at the time of the accident.

There has to be a better and safer product to remove sealant. Keep
looking.

Try to determine if the noise is radiated or conducted. You can disconnect the coax from the radio to check for radiated. It would be difficult to test for conducted while the car is moving. If it has an engine controlled computer, I would suspect it as the source.

Source record: 191151

There are plenty of mods.
I received E-mail from somebody owning a service manual:
When you open the radio (4 screws on the back plus four more
underneath the battery), look at the half that contains the
keyboard. On the PC board, at about the same location of the '1'
key on the other side, you will find a set of diodes. 3 double
diodes with 3 pins and some regular diodes.
Removing the uppermost double diode will convert the radio to
European bands.
I have not played around with any of the other mods yet.
B.t.w.:
When pressing 'band' and 'moni' simultaneous while turning on the
radio, you will get extended receive.

Have fun,
Arne Reykowski

Message-ID: <55t9f0$1ku$1@mhadf.production.compuserve.com>
Source record: 191152

Yes, there are plenty mods.
I just recently changed my IC-T7A to an IC-T7E.
I received some information by E-Mail from somebody who owns a
service manual for the radio:
When you open the radio you find a set of diodes on the
PC board behind the keyboard. The diodes are not marked, that's
why it is hard to identify them. There location is in the area
of the '1' key on the keyboard.
There are three double diodes (Three pin devices) and several
regular diodes. Interrupting connection on the upper most double
diode will convert the radio from IC-T7a to IC-T7E.
I have not tried any of the other hardware mods because I am
quite happy with this outcome.
There is however also a software mod:
Pressing 'Band' and 'Moni' when turning the radio on, will give
you extended receive.

Good luck!
Arne Reykowski

If you operate Amateur Radio from you bike, I'd like to know about the equipment you're using.

I would like to use a Kenwood HT and am curious about the stock headset and helmet compatibility. Also, what are you using for a weather proof PTT switch on the bars.

Finally, did you make a custom wiring harness or find something "off-the-shelf".

In article <5537vk$rci@jupiter.ks.symbios.co m>, From
lloyd.harmon@symbios.com (Lloyd Harmon), the following was written:
> I just read a Ten-Tec add offering a 6 meter fm transceiver kit,
> output five watts. OK. It goes on to add " (sorry, FCC rules forbid
> sales of add-on power amp) " . Since when was five watts the leagle
> limit on 6M? Anyone know whast up with that?

I beleive the problem is that any amp for use below 144 mhz requires FCC
type certification--probably a costly process.

2136. Fuel Pump Interference E-350 Van...HELP

Newsgroup: rec.radio.amateur.equipment
Date: 1996-11-07 00:00:00 UTC
From: trl@richmond.infi.net
Message-ID: <55rmsk$g2v@nw101.infi.net>
Source record: 191250

I have recently installed a Icom 735 in my 1996 Ford Van. I tried to do the things that I have seen over the years to avoid problems. I have the base of the antenna grounded to the frame as well as the rig. The exhaust pipe is grounded and I have the rig wired direct to the battery posts. The problem is a noise when the van is running, it sounds like static or white noise. The interference takes out the signals that are not S7 to S9 (bummer). Then I noticed that before it start the van, when I turn the key on the fuel pump runs a couple seconds then stops until you engage the starter. When the fuel pump runs the noise is there and when it stops... so does the noise. Of course the fuel pump runs all the time while the engine is running.

There may be other interference that I would hear if I got rid of this noise but the fuel pump seems to be a major problem. I also put the rig in a 1997 F-150 and have the same problem. I am going to try a phone call to Ford, maybe they will have some ideas.

If anyone has figured out this problem I would really appreciate your help!!

Please reply via E-Mail since I can't get on everyday.

Thank you!!

Tom

Hello group,

I need information on this radio. Its a crystal controled FM
transmitter for 2 Mtr.

I need the manual and schematics. The reson is because the radio has
problems on transmitting.

Let me tell you what happens now, I installed new crystals and ever
since that moment the oscilator stops after transmitting for +/- 4
minutes. Could the reason for this be that the crystals arn't conform
the calulation used for this radio.

Hope the here from anyone,

Hello all,

I just finished this mod with full success...except for one thing. I
can no longer get my software to perform a successful download to the
radio. I have tried merging old files with new files etc... Could
someone please e-mail me an empty .rdf file that will work with this
mod? Any help will be greatly appreciated. Thank you in advance,
Shawn

I had the same problem with my 440 and one of the reasons I moved up
to a 450 was the ability to run in FSK mode. That cured the problem.

Does your MFJ have an FSK output? If so connect that to pin 2 of the
13 pin DIN plug.

James,
I am using the Larsen KulGlass antenna. It is a 5/8 wave through the
glass antenna. Previously I had used a Radio shack 5/8 wave mag mount
on the roof... There seems to be no difference in reception or xmission
distance, and the install is clean and doesn't scratch the paint... I
paid 61.00 from AES.
Welcome to the air!

Later,
Dave

For a good basic (used) HF rig I recommend the Kenwood TS-120S (no WARC bands) or the Kenwood TS-130S (WARC bands included). I use the TS-120S myself and highly recommend it for a basic low cost all solid state rig. This rig has a fairly good noise blanker, and it comes with pass band tuning and RIT. The receiver is very sensitve, and you can add an optional cw filter. The rig has a digital frequency readout, but uses an analog VFO for tuning. You can't store frequencys in memory like a synthesized rig, but you also don't have problems with synthesizer phase noise in the receiver like a lot of the older fully synthesized rigs.

You can get the TS-120S for $300.00 to $350.00. The 130S is about $50.00 higher. They also made a remote VFO for both models.

I run SSB/CW and some low power RTTY on the rig and my only complaint is I wish I had the TS-130S for the WARC band coverage!

73's!

Hi Gary,I am IK5WQO and I am an happy owner of a small Kenwood TS-50:it is very compact,it is powerful and not much expensive,and I enjoy this transceiver very much,working from 80mt to 10 mt bands(not 160 and WARC,because I haven't antennas...)
It can be used with AT-50,the small antenna tner,wich is the same size of the transceiver...Good work on HF bands,and ...hope to hear you on the bands!
(P.S.:i work both phone and CW,and,after about 3 months of activity,I have more tan 100 countryes worked...and all with dipole antennas,or vertical from the car,or also magnetic loop(very compact antenna,works very vell for its size!!!)

>weeks)? I'd really rather not remove and reinstall the
>antenna and mast.

Yes, you need to stablize the mast. You can do that with wire cables to the tower legs, wooden blocks wedged to the tower legs, etc. Cables with turnbuckles are probably the best approach. They can be tensioned to hold the mast well centered, and won't be dislodged by the wind torquing on the antenna.

>Also, if the hex set screws that fix the mast clamp
>to the rotator output shaft are really frozen, what are
>the methods (in order of increasing desperation) for
>dealing with them - liquid wrench, EZ-out?

Before you *touch* the first screw, soak them in Liquid Wrench for 24 hours. Use a well fitting hex bit and a hand impact driver (available at Sears). The impacts will work the screws loose without torquing them off or ruining the heads. Be patient, don't use an air wrench, just keep tapping away. If the screws are really stubborn, heating with a propane torch and resuming impacts can often help.

If you do torque off a screw, you'll have to resort to the
EZ-out or drill them out completely (which will force you
to retap the housing for a larger screw when you put it back).
If you just wallow out the socket, then you can weld in an
extension hex bit and work the screw out with vicegrips.
Neither of these methods is easy when high on a tower. Best
is to avoid torquing the screw off or wallowing the head in
the first place. Don't use worn hex bits. Make sure you have
a really tight fit. If necessary, upset or grind a bit to be
a perfect tight fit before you start. Use an impact driver,
don't just crank on a hex wrench with a cheater bar. A few
extra minutes of preparation can save you hours of frustration
later.

I bought the UT-101 DTMF option for my IC-2000H today but it doesn't seem to work! Are there any known problems with this option? I know another ham who has it and HE can't get it to work either. If anyone can help me figure this thing out I'd appreciate it. I installed it properly and I'm following the instructions but no luck. One of the many things this does is let you punch in freqs from the mic keypad. This should be standard on all rigs in my opinion.

Hello Everyone,

Any comments on the Hygain DX-77 multi-band vertical for HF. How did you like the instructions for putting it together? How were the materials? How does it perform as compared to other antennas you currently use? Overall satisfaction? I had the Cushcraft R-7. I thought it was just ok. I had a butternut ground mounted vertical that would consistently out perform the R-7 on 40 and 30 meters. I had both of the antennas working at the same time to make the comparison. Just some general overall comments would be appreciated about the DX-77

Typical, it is not. While it is true that it use audio DSP (not IF) is
is a very good design. THe radio has excellent N/R (better than 870) and
the CW filter is optional. The recvr is very clean and easy to use and
menu driven. The CW auto tune is very slick and the radios
construction/layout is superb (much,much simpler and cleaner
design/layout than the 450) Also the hole chassis is cast aluminum and
used as heat sink. It's hands on performance is very impressive. I have
had one apart and actually talked with the engineer that designed and
built it!

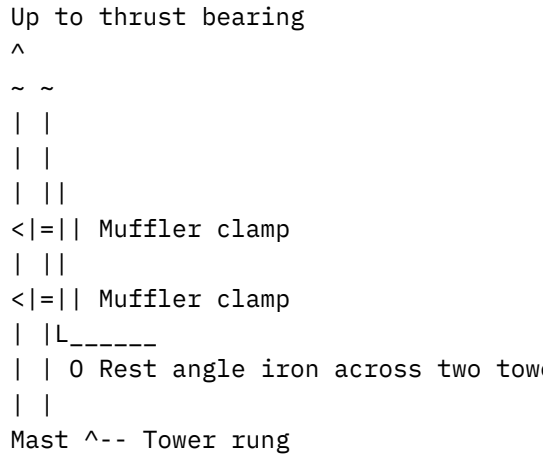
> >antenna and mast.
>

I had this same problem, and got a 2-foot length
of steel angle iron (about 2" x 2" sides, 3/8 thick) and mounted two
3" muffler clamps projecting outside the angle, and then
mounted one much smaller clamps on the same side. I placed
the bottom flat on the tower rungs, and clamped the mast in the
3" clamps (I have a 3" mast, you might use smaller clamps). Then
I used the other one clamp to secure the angle iron to one of the
tower legs (it projected out through the angle iron on the same
side and in the same direction as the mast clamps). This held a
VERY big antenna array quite securely through a number of subsequent
high winds.



>
> >Also, if the hex set screws that fix the mast clamp

> >to the rotator output shaft are really frozen, what are
> >the methods (in order of increasing desperation) for
> >dealing with them - liquid wrench, EZ-out?

I will echo Gary's comments on the hex screws that
bind the mast clamp to the mast. The screw that bound the
mast clamp to the 'D' key on the rotator shadt was frozen,
and even drilling it out did not free the clamp (it merely
messed up the 'D' key enough so that it would not budge. I
ended up hack-sawing off the rotator shaft. There is little
room, so you need one of those mickey-mouse looking hacksaw blade
holders. This whole episode took 7 hours on the top of the tower,
and is not highly recommended.

From: Ken Sturgill <KENLS@NETVA.COM>
Message-ID: <328355D3.767F@NETVA.COM>
Source record: 191178

I have been out of ham radio for seven years and am now buying equipment to resume the hobby. In searching for an HF amp. I have found a Henry 2KD5 locally. It is cosmetically like new, wired for 220 v., has the 10 meter kit installed, and shows about 1400 watts output with 100 watts of drive.

The person selling the amp is asking $900. I need some input here, is that a fair price? Any constructive comments would be appreciated.

>Thanx! James
>
Hello James, I use a ProAm GM270 glass mount with my Kenwood TM732.
It seems to perform just as well as my Comet B20 mag mount, although
the ProAm is a much thinner whip and tends to flop around when mobile.
This causes weak signals to fade into the noise, but works fine on the
local repeaters.

>
P1 and P2 are not used on this radio. I guess this mic is used on other models
as well. ACC, whatever it means, toggles which half of the radio you are
controlling.

>2) Is that an LED in the left? what for, TX/RX?

The LED on the mic is to indicate your are pushing a DTMF button. The radio
makes no sound while you are pushing the DTMF tones, so this is your only
indication.
>
>3) Besides the programmable keys, does the radio have mic. remote
>control? Are there key combinations (using the "white" keys) to
>control all of the radios functions like on my Alinco 610?
>
No. Basically all you can do with the mic is PTT, toggle left or right radio,
and generate DTMF. Kind of a let down if you like to remote control the radio,
eh? If you really want to remote control the radio, you might take a look at
the FT-8500. I don't know what you can or can't do on it, but it has buttons
out of control on it's mic.

>
>73,
>Bob
I have a pyramid 20Amp on the desk driving a dual band mobil rig. If you buy a large power supply, as your privileges increase, your supply will handle all your new radios. If you can afford it, buy about a 20 or so (continuous). It will always power your stuff, even if you add rotators, packet, ATV etc. Astrons are good units, but if you shop your local hamfests and electronics dealers, you will find good deals on pyramids or others. I recall mine ran about $100. Once you have one - you have it.
By the way, I like front posts so adding and subtracting equipment does not require the hassel rear posts might. Rear posts help keep the shack a little cleaner. Also my unit has voltage adjust pot meter and current meter.
I have KW rigs similar to the 733. Love 'em, mobile or base.
Good Luck

2197. Attention MR-8100 Owners

Newsgroup: rec.radio.amateur.equipment
Date: 1996-11-08 00:00:00 UTC
From: Ken Wyatt <kenw@col.hp.com>
Message-ID: <3283BEEF.1AFF@col.hp.com>
Source record: 191189

As promised, I have added the original Uniden MR-8100 programming software, SCAN.EXE, (with permission from Uniden America), along with the newest version (0.9) of the Windows-based programming front-end, PSCAN, to my Web site as downloadable files. SCAN.EXE is not too large, but PSCAN is 700K and will take a bit of time. PSCAN is also available from the HamNet Forum on Compuserve and the Ham Radio User Group on AOL. Both programs are required.

http://ourworld.compuserve.com/homepages/Scan_PikesPeak

Those of you who have acquired this scanner, but are without the programming software, will find this indispensible.

Regards, Ken

Johnathan,
It wouldn't hurt to clean the relays anyway. I have a 30S1 and I'm always covering it up. Order or buy local a relay burnishing tool, most of the cheaper ones are sold/made by GC Electronics. I use a very small amount of Craig Labs stuff, know by two or three names of : Cramolin, De-Oxide, R-5, R-2 and ProGold. Which ever one you can find will help alot. Use very little as this is an RF/HV point and then wipe it off. I've had trouble with the input section of the RF relay. Put a meter in line and watch the SWR from the amp back to the exciter. You may be seeing the same thing happen in yours.

Hi Scott ...

I have a 450 and 690. I do not disconnect the mic on either.

I seem to remember that the pins on that accy connector were
labeled wrong ... or at least the translation into english made it sound
like two pins were interchanged. I had to swap them to make things
work right. I don't have the paperwork now so if your diagrams don't
suggest that flip-flopping two wires will work, let me know and I will
look it up.

I mounted a 2 meter/ 440 dual band rig to my quad and used a remote PTT mounted on the handle bar near the left hand grip. A remote clip on mic is attached to my helmet and an ear piece. It is very comfortable and a blast to use while ride the trails. The remote kit was bought from HRO in Burbank, CA. It was about $60 and they come with plug for either ICOM or Kenwood.

>Bill Holbert Sr., W5BBR

For the finals, the alignment calls for adjusting VR7002 for 6 mV
across R7027, which is 0.025 ohms, so that's... let's see... I get 240
mA.

For the drivers, adjust VR7001 for 40 mV across R7014, which is 5 ohms
(I think), so that's 8 mA.

From: Brad Thomas <bgt@thomascomm.com>
Message-ID: <32838CA6.F5A@thomascomm.com>
Source record: 191206

The VX-10's FTT-15 keypad/encription will not work on the
FT-50. Different plug and wrong firmware on the amateur model.
Nice try though.

The VX-10 and the FT-50 are in the same case. Alpha display is
better w/ more chars. than the 50. VX-10 is single band.

Message-ID: <19961109131900.IAA14294@ladder01.news.aol.com>
Source record: 191076

Kemwood acknowleges a problem with the TNC overdriveing the audio cicuit
when you are in ssb mode. This is described in their service bulletin
1002. They give a fix that involves changing some surface mount parts.
Another solution is to use FSK instead of AFSK thus leaving the audio
line disconnected. They also recommend powering the PK-232 from a
different soure than the radio to reduce noise.
The service bulletin is "hidden" in their www home page - in their FTP
server.
Personally I am going to use separate power supplies anf FSK to solve the
problem.
Hope this helps -

This summer I visited Hong Kong and went to quite a few of the shops selling cameras and electronics. Many of these shops also sell ham radio equipment. I purchased an Icom T22A HT at the shop listed below. When buying in person, these shops expect you to haggle over the price. With careful negoiation you can ususally get them to accept about 60% of their first asking price. I don't know if prices are fixed for mail orders. Be careful when buying in Hong Kong as the equipment may be an Asian or European version (always ask). I was able to buy a USA version of an HT. Also, be aware of the exchange rate for Hong Kong dollars before you buy.

As another comment, I have tried the RAY O VAC "renewal" cells, which are rechargeable alkalines.

These cells are really optimized for low current drain applications. In a receiver they are excellent - I have gotten many charge cycles from the AA size in small receiver applications. However, for transmit usage they are not very good at all, particularly after the first discharge cycle. They seem to have high internal resistance. The Ray O Vac documentation describes this situation, so it is not a suprise, but they are not a good alternative to NiCads or NiMh for transceivers and transmitters.

rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.space,rec.radio.swap,sci.electronics.equipment

I have a copuple of PTS synthesizers for sale. These units are the 160 MHz version. Here are some of the specs:

Frequency range .100 000 MHz to 159.999 999 MHz
Resolution 1 Hz to 100KHz in decades
Accuracy 1 x 10^-8/day +/- 1 x 10^-6/0 - 50 C
Control Local by 10 position dial; remote by ttl level
parallel entry BCD or GPIB

Switching time 20 to 5 microseconds
Output level +3 to 13 dBm (metered in dBm and volts)
Flatness +/- 0.5
Impedance 50 ohms
Harmonics -40dBc
Discrete spurs -75dBc

Phase Noise -63 dBc (0.5 Hz to 15 KHz) incl. effects of
internal STD
100Hz/105dBc, 1KHz/115dBc, 10KHz/123 dBc,
100KHz/127 dBc
Noise Floor -135 dBc/Hz
External drive 10 MHz or 5 MHz (internal TCXO included)
Weight 35 Lbs
Mounting Rack chassis

I have scanned images of the price sheet and specs/picture sheet. These are available upon request. These units sell new (with all the included options) for over $8000. I am selling them for $500. They all have minor cosmetic scratches but are in full working condition. If interested please e-mail me at:

I've talking to an ICOM America outside sales representative and she
said that the IC-756 will be available in the US around the end of Dec
or early Jan. They are waiting for FCC approval which is guaranteed
since (she claimed) the radio exceeds all FCC standards. It's just a
matter of the FCC getting around to it....

Try connecting your hot lead to the battery itself and not through the fuse box (if you don't have it this way already). Then you need to make sure that you have found a GOOD place to ground your radio. If you still have trouble, try using a high quality noise filter. Most of the time a good power connection will solve noise problems.

Oh, one more thing...make sure that your noise blanker is turned on. More times than once I have started getting a noise problem, only to find that the noise blanker got turned off somehow.

Good luck and happy DXing!!

2236. Yaesu FT-1000D Questions

Newsgroup: rec.radio.amateur.equipment
Date: 1996-11-09 00:00:00 UTC
From: "James M." <james119@iu.net>
Message-ID: <32850A0B.1DC4@iu.net>
Source record: 191095

Just bought Yaesu FT1000D (NOT the MP). So far, am quite pleased, but I am beginning to notice a few problems, and would like to know if anyone else out there has seen these and has obtained fixes for them. Are there any service bulletins related to these that anyone knows of? :

(1) Very audible blower noise. Apparently a common complaint. Mine makes a slight "groaning" noise as it comes on and turns off. Most people say "get used to it" or "use headphones" but I don't care for either answer.

(2) Audio intermod/distortion when copying CW, if there are a large number of strong CW signals in the passband (like a pile up). Mostly when on 250 or 500 hz settings. Normally not noted when copying only one signal. Yes, the NB is OFF when this happens.

(3) Slight AGC overshoot, i.e. AGC attact time is a bit slow causing some audible distortion right at the onset of a voice peak. (This could also be the cause of (2) above).

(4) NB really doesn't seem to work that well. Distorts voice signals when adjusted high enough to blank line noise. (may not be adjusting it right.)

I've checked the two Yaesu FAQ news groups and no hints there. ANy help out there? Any other discussion regarding the FT-1000D?

Thanks,

Jim N4BE

2237. Slingshot lines over trees for HF antenna...Advice?

Newsgroup: rec.radio.amateur.equipment

I am hoping to put up a full wave horizontal loop for 80 meters, and want to use some of the big trees around our house to hold up the corners. Figured I'd try using one of these high-powered slingshots to launch a line over the tree and then pull up that corner of the loop. Has anyone done this..what kind of line did you use? Do you have to use monofilament to start with and then pull up something like nylon rope after that for the actual line? Any advice is greatly appreciated! :-)

Try replacing the fast-blow fuses in the power cord with some slow-blow fuses.

My 890 kept cutting out on me and I discovered the fuses were at fault. Seems the current drawn by the radio would cause them to break and as the current was cut (blown fuse) the fuse would "heal itself".

Drove me nuts ... the fuses tested ok on a resistance check.

Let me know if this helps!

BOB:

I believe the sample port is -40dB down from the input power. Slugs for this beast tend to be rather expensive since they each cover a limited frequency and power range, but it is indeed easy to use. Just insert the slug with the arrow pointing to the antenna to measure forward power, toward the transmitter to measure reflected.

I don't know how wide a freq/power range you need or what you paid for the 43. If you find yourself looking at a big $$$ outlay for slugs, you might want to sell the 43 and look at a Telewave 44 which is wideband (30-1000 MHz) and has switches for power range and forward/reflected... no slugs needed. I've used one for about 5 years and never had a problem with it.

Mike:
Years ago I did this successfully. I used a very fine monofilament
line fed from a light weight spinning reel. I assume that you are
using a marble size ball bearing type shot. If so you can drill a
small hole through it and secure the monofilament through it.
I was able to get it up about 60 ft with no problem.

Good thinking , Bob , its probably no good over 5 gig's either.

2253. FS Kenwood, Icom, Alinco, Yaesu DC Plugs

Newsgroup: rec.radio.amateur.equipment
Date: 1996-11-09 00:00:00 UTC
From: n2cjj@ibm.net
Message-ID: <560ld3rga1@news-s01.ny.us.ibm.net>
Source record: 191208

I have found a source for those DC power cord plugs. The ones I've got use male plastic with 6 metal female (barbed) inserts.

The plug fits most 12VDC HF radios:
Icom 720, 730, 735, 706..and alike, newer Yaesu and Alinco DX70.
Kenwood-TS120, 130, 140, 430, 440, 450, 850..TS50, 60, 660, 670, 680..and more.

Make your own power cord yourself, YOUR WAY!
Crimp or solder, short or long, heavy gauge wire, purple with pink polka-dots...

Each DC Plug comes complete with 6 crimp/solder inserts
for $4 each, or the deal 3 for $10.

All prices include postage in the US and Canada.

To order, kindly send a check in US funds to:

Robert Langston
286 Hudson Street
Cornwall-on-Hudson, N.Y. 12520

You can also email me for info at: n2cjj@ibm.net

It's a great deal if you use one rig at home, in the car or at work and are stuck re-connecting and dragging the power cord all over....

It sure beats paying $30 for a spare from your dealer.

2254. MFJ 432 and TS-850... Help!

Newsgroup: rec.radio.amateur.equipment
Date: 1996-11-09 00:00:00 UTC
From: bob@waterw.com
Message-ID: <560o2a$3sj@sea.waterw.com>
Source record: 191209

I've got an MFJ-432 voice keyer that works great with my IC-735, but doesn't play with the TS-850. Yes, I changed the internal jumpers to the K position. The problem appears to be very noisey audio; if I turn the 432 output level way down, then turn down the mic gain on the rig, the audio sounds clean, although low. As the mic gain is increased, a large amount of noise is suddenly apparant. This probably isn't RF feedback, since it happens when the peak output is only 5 watts too. It's not related to antenna problems; it happens on several dipoles and a dummy load.

Does anyone else have this combination playing together? Any clues to the source of the problem?

Thanks
Bob - N2TA

ALERT!!!
The Alinco Blowout is a bad deal! The radios do not exist and the indiviuals selling these ghost radio are being sought after by the appropriate authorities. A source close to this company has admitted that they only have a few units and most of them are in bad condition and missing serial numbers. It is known that Alinco will treat any radio as a stolen one if they receive it without a serial number. Don't be stupid! If it sounds too good to be true..IT IS!!!
SPREAD THE WORD!!!

2257. "Heavy-Duty" or Alkaline AAs in a HT battery pack?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-11-09 00:00:00 UTC
From: ag001@lafn.org
Message-ID: <1996Nov9.025917.7585@lafn.org>
Source record: 191212

I will be soon flying overseas & taking my 2-Meter HT with me
(yes, I have the reciprocal license). However, rather than constantly
re-charge the NiCad on 220v with a transformer, I've elected to take
an AA battery back with me. I can get a much better deal on "heavy-
duty" (non-alkaline) batteries -- but would 3 watt transmitting eat
them up very rapidly? Is it better to spend more for alkalines?
Batteries are expensive where I'm going so I want to take alone a
2 week supply. As far brand names, any preferences? Duracell better
than Energizers? Third party brands?
Much appreciate any advice.

Source record: 191216

Abraham,

I travel a lot and just went through the same questions, so I ran
a few tests. I in no way claim that they were scientific, so my findings
are likely suspect in any close analysis, but here goes:

The "Heavy Duty" carbon cells are significantly poorer than are the
alkalines.

The regular carbon cells are pitiful compared to either Heavy Duty
carbons or alkalines. My battery icon came on after a couple of minutes
or transmit on my FT-50R.

Alkalines are a better value and last long enough more to compensate
for their higher price.

Among the alkaline cells, Duracells, Radio Shack, and Energizers perform
about the same.

I now buy any of the latter, based on which is the best price.

Regards!

bernie

Use your web browser to go to Kenwood's web
site:http://www.kenwood.net/amateur.html
You can see the TS570 there.

In article <55nfee$2qo@ci.ist.utl.pt>, l38217@alfa.ist.utl.pt says...
>
>

2270. TS570, rig review and comparison

Newsgroup: rec.radio.amateur.equipment
Date: 1996-11-10 00:00:00 UTC
From: Rick Lapp <rickl@unix.asb.com>
Message-ID: <01bbcf14$63548680$1380fea5@ricklunix.asb.com.asb.com>
Source record: 191025

These are my Impressions of the TS-570 after a day or two at the controls. My thanks to Joe, W2HPM who also spent some time with me reviewing this new Kenwood.

I'm comparing the radio based on others I have owned:
940, 765, 850, Omni6, 450, 50, Delta2, and a 706. I've also operated the FT-1000 enough to compare it to the others.

The radio was setup by removing all the connectors from the 450 and simply plugging them into the 570. Only the CW jack changed from a "phone jack to an 1/8" mini which was quickly fixed with an adapter. The amplifier keying and PK232 interface all worked exactly as they did on the 450.

The LCD display reminds me most of the IC-728. The numbers are large and easy to read. The backlight is adjustable via a menu selection. The meter is a nice compromise between an analog movement and a bargraph, since the LCD segments are laid out in a radius, resembling an analog movement. This is a simultaneous
S meter, power level, SWR, Compression level and ALC. It looks like the audio level function in the 450 was left out of the 570 meter. The peak hold function works well. (2 segments remain at the peak level for about .5 secs.)

The front panel is well laid out. It's exactly the same size as the 450 but MUCH easier to operate. The location of each of the buttons has been well thought out for operator convenience or efficient contest operation. The buttons are rounded rubber, not the squared off plastic and metal ones on the 450 and 850 and 940. The buttons are divided into groups depending on function. Each one of these groups has a different shape and feel - a nice touch for the sightless or sleepy contest operator who has his eyes on the monitor and only his left hand on the controls. The buttons work easily and don't take much effort. This was annoying to me on the 706, Delta2 and Omni6 which take entirely too much pressure to make contact. This is an important point for contestors.

Joe pointed out that a "reminder" LED was missing from functions like notch (beat canceler and noise blanker) although the LCD segments for these functions are of good size and difficult to miss.

The receiver was compared side by side to my 450. Without doing extensive lab tests with a signal generator, it's seems that the receiver is somewhat more sensitive yet quieter from phase noise. I didn't seem to need the pre-amp in situations where I needed it with the 450. The Noise Blanker seemed effective to pulsing noise and compared to the 450, did not cause the usual distortion on strong signals or strong adjacent signals.

IF shift control works well and I'm please to see it with a center detent, like the 450. I tend to leave mine a few degrees off center which seems to emphasize the lows of a SSB signal, making the signal sound "full".

The memory channel selector knob doubles as a menu selection control. The following functions are not controlled by the menus but can be individually controlled with this "multi" knob: mic gain, pwr level, keyer speed, vox/break-in delay, and bandwidth selector.

The menu function is extensive, yet fairly easy to use. It is similar to the 450 and 850 but has an alpha numeric scrolling display describing the function so you don't need to constantly refer to the manual. We were able to set and control most of the menu driven functions for the first time without referring to the manual.

The DSP function is in both the transmit and receive audio circuits, not in the IF like some of the other radios currently on the market. There are advantages and disadvantages to both techniques and Kenwood has chosen to put it in the AF. I think this was good choice, although I haven't compared it to an IF DSP radio. The complaints I've heard about transmit and receive audio distortion in the 870, appear to be non existent in the 570. Both transmit and receive audio are clean and non-distorted. Even with the DSP beat canceler or DSP Noise Reducer functions on, receive audio is still clean, although it is possible to hear a hint that the audio is being "processed". There is no comparison though to the distortion introduced in the audio through the low end Radio Shack DSP unit. There are two NR selections. NR1 and NR2. One is used normally for SSB and the other for CW. These tend to reduce background "hiss" and is a separate function from the Beat Cancel which works well on SSB. Kenwood could have had the NR1 and NR2 functions automatically selected depending on mode selected, SSB or CW. I don't know why they didn't do this. I'm mostly a CW operator and the NR2 works well but may not be that pleasing to listen to while copying CW at over 40 WPM. There is just a hint of rising edge distortion as the DSP does it's work. What is impressive however, is the "hiss" reduction with the NR function enabled. The receiver is almost completely quiet except for the desired signal.
It would be interesting to compare this DSP with one of the high end external DSP units. The Beat canceler does a fine job of eliminating heterodynes on SSB and does not add any objectionable distortion to the received audio.

The CW tuning is cute, but I'm not sure how often I'd use it. Perhaps new operators or contestors would find more use for it than I would. I suppose my ear has enough training and experience where I don't see that it's necessary. It is not as precise as I thought it would be as it usually comes within 10 or 20 Hz of the correct frequency depending on signal strength, QRM or keying speed.

I installed the 8Mhz, 500Hz CW filter in my radio. It appears that there is only one spot for this additional filter - I would not be able to install a 1.8Khz filter with my CW filter installed. I don't see this as a problem since a combination of the DSP slope tuning and the IF shift does an adequate job.

On CW, the IF filtering works well. There is a filter bandwidth control that controls the DSP AF bandwidth. The DSP bandwidth is variable from 2.0Khz to 1.0Khz, 600 Hz, 400, 300, 200,100 and 50 Hz! The resulting combination of 500 Hz IF filter and DSP AF filtering reminds me of the Jones Filter arrangement that Ten-Tec put in their Delta2 transceiver which was continuously variable from wide down to less than 100 Hz. I found it difficult to find a crowded portion of the band where the 570's IF and DSP AF filtering could not effectively knock out adjacent interference. Compared to my 450 which had both 8Mhz and 455Khz, 500Hz CW filters, the 570 seemed to be cleaner with less "ringing" while copying CW at narrow filter settings.

The automatic antenna tuner seems to do a good job of matching the radio on any band to my 80 meter dipole fed with ladder line through a 4:1 balun, although the 450 never had a problem either. The "AT Tune" function is different than on the 850 and 450. Kenwood saved the "Auto/Thru" button and put both functions on one button. Depressing the "AT Tune" button toggles the tuner on or off. Holding it down for longer than a second, starts the tuning cycle. The tuner sounds much different than previous Kenwoods. Rather than hearing the whirring of a motor, it sounds more like a relay chattering. It took some getting used to. I'm curious what they did different with the tuner that makes it sound like this. The tuner, like previous radios, memorizes settings for each band.

On Pactor, Amtor and RTTY, the radio performed well. The variable bandwidth of the DSP filter is a nice feature when operating on the digital modes to knock out any adjacent frequency QRM. On transmit, I was able to operate at 100 Watts key down on long FEC and Baudot transmissions with no temperature excessive rise. The radio seems to handle this 100% duty cycle operation. A nice feature for the digital modes are menu selections to vary BOTH the audio input and output from and to the TNC.

On CW, the 570, in my opinion, is the best Kenwood yet that I've operated. My criteria for CW operation is mainly how smooth the transmit to receive transition is, how smooth the sidetone sounds and any audible noise or clicks from either the speaker or relays while on QSK or semi-QSK. The amplifier keying relay is easily enabled or disabled via a menu selection and with this relay disabled, the radio is very smooth and quiet in QSK. During QSK, you have to strain to hear a small, perhaps reed relay. I heard very little, to no difference in another receiver while switching between semi-QSK and full break in while sending a string of dits at 50+ WPM. This is a test that Joe and I usually run to see how good the QSK operation is and essentially duplicates the CW dual trace scope photo you see in the QST rig reviews. On QSK, I would rate the 570 second only to the Ten-Tec Omni 6 for silky smooth QSK operation and nice sounding CW on receive.

Although the AF output stages are spec'd at 1.5 Watts for the 450 and 570, the 570 seemed to have somewhat less audio drive into my external speaker than the 450. It's not a problem since I never seem to run the audio gain up less than 10 or 11 o'clock . The audio quality on SSB and AM was clean and comparable to the 450.

We ran a number of transmit audio tests on 75 meter LSB. Using a Radio Shack Highball mic, the consensus was that "High Boost" transmit audio equalization, and the mic gain at 40, seemed to work best. A half dozen critical ears on the frequency preferred the 570 over the 450 for transmit audio quality.

I'd be interested to hear from other 570 users and will try to answer question from others who may be interested.

If $60 is not too much, the GE Superadio III will fill the bill; not a clock radio (its a portable, but with AC cord), but it has a great internal antenna (you turn the radio to peak the signal), but also an external antenna connector.
Service Merchandise had them on sale for about $40 earlier this year.

2273. FS: P110/OPTO/MT1000

I have the following idems for sale:

1) P110/GP300 - 16 Channels - 1 Hour Charger - 2 Batteries - Mircrophone
- Antenna Adapter (For External Antenna Use) - Programming
Cables
- Rib Box. Asking $350.00 + Shipping

2) Opto Scout Model 40 - Antenna Supplied - Box & All Manuals
- Plug In Quick Charger. Asking
$300.00 + Shipping

3) Motorola MT1000 - 16 Channels - Antenna - 16 Hour Charger
- Brand New Battery Pack - Programming Cable
- Rib Box (If I don't sell it with the P110
it will be sold with
MT1000) Asking $325.00 +
Shipping

Call me for more details on the equipement.....if needed! Realize I am
FIRM on the
prices I ask. I am wanting to buy a SYSTEM SABER so I must sell all
this equipement in its place.

Thanks for your comprehensive report on the 570. To answer your question on the tuner, a friend of mine has one and said the tuner used switched capacitors instead of motorized air variables. His tuner failed after tuning to a low impedance load (something like 14 - j2000). It provided a match but two of the 2KV ceramic caps burned up. Kenwood thinks it's his own fault but if the tuner provides a match then how would the operator decide not to use it? Kenwood is sending him two caps anyway. We think that the caps (in the output side of the T configuration) actually had too much current causing them to sizzle.

To translate Ken's words for our Norwegian friend:

A.E.S. = Amateur Electronic Supply (U.S. company)
The 800 number is obviously NOT accessible from Norway!

Kjell: it would be best for you to search European sources for
new tubes. 8875s are not easy to find. Are you sure both are bad?
Such power tubes rarely fail completely unless terribly abused.

Mike: I agree, Its a blast to use the slingshot. they are cheap - I paid five bucks for mine and it worked like a charm. I'd add a couple of ideas to the suggestios you've already received:

-- Paint the sinker red or orange so you'll be able to see it when it comes down on the other side.

-- Wear eye protection during the entire operation.

-- Do it shortly after dawn on a Sunday morning (to minimize collateral casualties and to keep the neghbors from thinking you've gone totally bonkers).

Good shooting! 73 Bill N2CQR

I haven't used a slingshot, but I have done it with a bow and arrow, which worked fine. I used 12-pound test monofilament line and then pulled up the working line with that. I have 120-foot trees on my property and the arrow can easily clear them even when dragging the line.

Thanks for the mention.

I work for MAGNECOR, we manufacture spark plug wires designed to solve extreme radio suppression problems, for example for vehicles fitted with ameteur radio equipment.

I can't guarantee we can solve your problem. But you may be surprised, we have solve many serious problems for others.

If you want me to send you more information call me at 810-669-6688 or e-mail to magnecor@teleweb.net and I'll send you some technical information.

We also offer a small extra pricing deal for orders received from internet postings.

ask for STEVE (I'm the sales manager).

> 73,
> Ed - N5KZW

Im not familiar with the 706 but I do have a friend who owns one...first chance I get to look at his manual, I'll see what can be done..

ALSO a 2mtr 5/8wave antenna (like a Larsen NMO-150 or Signals equiv) will work as a base loaded 1/4wave on 6 very nicely!!!

Or you could use a diplexer to feed the 6mtr signal and the 2mtr signal together....(take a diplexer and split HF and 6 and then combine 6 and 2 with another one....a pain but it will work...if you can get 6 out the 2mtr port, that would be the best way!)

I agree with the TS-120 or 130 being a great starter rig... I do not find the 747 to be a good choice because although it is solid and reliable its selectivety is poor in SSB and it lacks and IF tuning. The now discontinued TS-140 is a very good rig. Very solid, Packet/RTTY ready, better selectivy (compared to 747) and IF shift tunning. I have used one mobile and as station backup for 4 years without a hitch. It is also very SWR tolerant (I used it mobile without a tuner with excel results)
